Lately I have even overheard some people saying that if the Gov introduced under-skin chip ID'S it would not bother them !!!!!!, what the FUC* is wrong with these people they are obviously well brainwashed into this modern world of the orwellian outlook stuck living in their safe little house oblivious to the ramifications of what they are saying. Me for one would kill any person who tried to put one of those near me.

Those are just a few "silly" but honest examples but take a moment of pause like I often do and think back to the things you all used to take for granted in life that you can no longer do or where it is now almost impossible, think back to the old days when you could earn an honest crust and have something left after the bills , now you probably lose 90% of what you earn if you take all the indirect taxes into account (fuel,tobacco, beer etc etc etc....this is just the start of it !.

this is a TRUE and honest outlook on modern life as it is now becoming.... No address, no job..... no job no house.....no job no money.....no money no status no place in society.....no place in society .....No one will know you are there, no one will miss you .

Maybe I am a tad paranoid but with good reason, I am someone who used to live outdoors and as free as you can get, parked up with a bedroom view of my choosing whenever i wanted to, never bothered anybody kept myself and the surroundings i lived in tidy, earnt my cash payed my way and got a whole world of shi* in return because i did not live in a 4 brick-wall box like they wanted me to and empty everything i earnt into their kitty through indirect taxes and OH!, god forbid I made the mistake of thinking for myself and expressing my thoughts and opinions.. WHAT PRICE FREEDOM !! ?.

Whoops you started me off on one now...and it's getting heavy ;-), bloody lucky i am not in CHINA with talk like that... OR AM I ?

hmmm. perhaps i should write a book :-)

regards

The eavsdropper

My friend I am but a mere cog in a big wheel...it is OUR hobby !!!
>
>There is a way to get even.
>
>Tell us WHO it was that did that so we know not to even bother with
>their sites again.

That is not my way, they are obviously insignificant and do not appreciate
the hobby and the people in it.
>

>
>That is really a shame, Ian, but I can't say I blame you for it either.
>Look what the scanner community has given Bill Cheek in return for all
>of his effort and knowledge. The guy's on the verge having a criminal
>record just because of one really ignorant bozo in NJ.

That is a very good case of what happens when people are stupid,
>
>It's very common to see people in this hobby ready to TAKE. By
>contrast, the numbers of those who GIVE BACK are really small. It's a
>shame that we'll be losing one more when Eavsdroppers is closed.

this is very true and that is all i have seen recently TAKE and no GIVE,
except for a few and they know who they are and they will always be welcome
to me.
>
>
>I think listing their names and allegations publicly here would be
>"thanks" enough, Ian. I for one would like to know who it was that
>brought all this on.

Go back a few days via deja-news and you will see !. I do not name names. it
is not worth it mate.

>I will do that Ian. I do have some back burner work that could use a
>stir..
>
your efforts will be most welcome by all i am sure if you have anything to
put about that you make or want to pass on code to improve it or whatever
you can do it via me and remain TOTALLY anonymous. even the other people

involved will not know who you are if that is what you request I am a filter for this work.

>
>If you can, here's what I would do on the main page of your site: Big
>bold letters of all the people who forced you to close and why. If you

What with all the mail i have had from people today i almost feel that i am letting people down, so i have popped 1 page back up temporarily so you can still download for now the decoder software i will change the names often to stop the assho**s linking to them.

watch these groups for updated URL

http://www.eavsdropper.dabsol.co.uk/decode.html

get it while you can in the U.S

cheers

>>Does anybody know what the freqs are for the construction crew working
>>on the Cental Artery construction in Boston?

a variety of frequencies are used by construction crews, mostly private 800 &
900 MHZ trunking systems.There are also comms using the 460 MHZ business bands,
mostly simplex. A lot of the tagging of cranes is done on the 154 MHZ "Dot"
freqs. of 154.54, 154.57, and 154.6.
The constuction management company, Bechtel Enginering, uses the MA State
police trunked system

Nope. UHF trunking and 800 trunking are different. UHF trunking does
not have a set base and offset frequency like 800 or 900 mhz does.
Outside of stuffing the guts of a 245 into a pro 90 case, I'd say you
can't do it.

Source record: 103692

I've had the D707 for about 7 years and have it hooked to an Icom R-7000. I have been very happy with it. It can overload the receiver on some freqs, but the gain is adjustable. I have several other roof antennas, but I have not really compared them head to head. It is well built and holds up to the weather very well. One down side is if the power goes out, it doesn't receive too much.

>

Yeah, anything is possible. But keep it simple. use the PP as your postable freq database. You can store all of the freqs you want in that thing and use it while scanning to ID whatever freqs you want to keep track off. There are a couple of db shareware progs that you can use to import your freqs from a spreadsheet into the PP. That alone is quite useful. That's what I do

>Beg to differ, but in my opinion .XLS is a lot more standard than .CSV?
>Just what application uses CSV files?

Spreadsheets. Stands for Comma Separated Values.
Commas between each entry means each entry gets put into the proper
column. ALL spreadsheets can read CSV into their own pages, but not
each spreadsheet can read .XLS. I have Microsoft Excel, but for
Office. The PRO-92 list may have been for Office 98.

I've lived in New York for 60 years and there has never been a permit
required to "carry" a scanner.. To listen to police in mobile, you
must have various requirements such as Ham ticket..

856.2125 is licensed to both Case Western and Bonnie speed as a "non-trunked" freq, service is GB. The only difference is location and wattage. Case is 44 Watts (ERP) and Bonnie is 20 Watts (ERP).

Bonnie has 35 mobile transmitters licensed at 35 Watts (ERP) each on 811.2125mhz and the radius of operation is 48 miles around the transmitter site at 2119 ABINGTON in Cleveland , while Case also has 35 mobile transmitters but at 10 Watts (ERP) each and their radius of operation is 16 miles with the transmitter site located at 127 Public Square in Cleveland.

The only data not listed is the subaudible (CTCC) tone freq used on each system to prevent interference from the other. Since they are not trunked any scanner with 800mhz band can listen to "all" the communications but only those that can select the CTCC tones can discriminate between the two sources..

enjoy

Fred

Urban Legend Alert!

I saw a news report just about an hour ago where someone claimed that
newer Coke machines were being equipped with temperature sensors so
that the machine itself could automatically raise the price in step
with the temperature. A Coke spokesman denied that they are producing
machines with this capability. Nothing in the report mentioned remote
pricing changes via a rubber duckie antenna on the back of the
machine.

However, if they do decide to implement this, you can be sure that
Coke will have to pay the new "Wireless Modem Tax"...

Source record: 103725

Clark County / Las Vegas fire is actually the hybrid Motorola Type II/i, fleetmap E1 P15, shared with a few other county services. Look for McCarran airport operations:

100-7 security
100-11 refueling operations
100-4 maintenance
(really 100-1 through -15)

other IDs for fire would also include:
41808
41010
41424 fireground
41744 fireground
41009
the listing of 41424 as downtown and airport seems unlikely because of the geography of the city, but I've seen it listed elsewhere.

the TRS where you'd find the Clark County School Police also includes the Fremont Street Experience Bike Patrol ..with the ambient crowd noise it always sounds like a near-riot.

405-1 and possibly 405-2 and 405-3.

there's also a downtown casino security department on this system, maybe:

400-1 and 400-2

there are actually quite a few other IDs on this system I haven't yet figure out.

on the North Las Vegas EDACS system, you could add:

01-042 Jail
01-023
02-026
and the uninteresting
01-061 and 01-062 public works.

Here is what I have. The School police channels are updated somewhere in my computer. Too lazy to look for it right now.

LV City and Clark County Fire use twelve freqs. the below listed contains 16 freqs I don't know which 4 are not used, but I do know that if all are loaded, you will here all transmissions.
855.7125, 859.4625, 856.2625, 859.9375, 856.4375, 860.2625, 856.7125, 860.9375, 856.7625, 856.2125, 857.7625, 857.4875, 858.7625, 860.4375, 859.2625, 860.4875

IDs Motorola Type II
CH 1- 40976 LV East
CH 2- 41008 County West
CH 3- 41040 County East
CH 4- 41072 LV West
CH 5- 41104/41004 City of N. Las Vegas Fire
CH 6- 41136 LV South
CH 7- 41264 Downtown/Airport

N. Las Vegas PD (EDACS) these freqs MUST be loaded in the following order!
856.7375, 857.7375, 858.7375, 859.7375, 860.7375

CH 1- 01-021 Dispatch
CH 2- 01-026 Car - Car
CH 3- 01-041 Jail/Talk around
CH 4- 01-025 Information

Clark County School Police Motorola Type unknown
852.4875, 856.1625, 857.5625, 859.1625, 860.1875

CH 1- 402-1 Dispatch

There is no input; It's not duplex. The same frequency is used to
transmit and receive both for the dispatch and patrol units. It is just
simplex, except for channels 1 and 3 and the detective channels 450-1
through 450-7. It goes as follows:

Ch 1- 154.890 and 453.100 Chase North Patrol and Detectives
Ch 2- 154.755 Special Assignment (Detectives)
Ch 3- 155.790 and 453.450 Chase South Patrol and Detectives
Ch 4- 155.370 Southeast Patrol (simplex)
Ch 5- 155.070 South Central Patrol (simplex)
Ch 6- 155.640 Northeast Patrol (simplex)
Ch 7- 155.520 North Central (simplex)
Ch 8- 155.430 Southwest Patrol (simplex)
Ch 9- 155.700 Northwest Patrol (simplex)

TomCat4680 (tomcat4680@aol.com) hath said:
: that range isnt trunked

I beg to differ, YES there is UHF trunking.. We have 2 trunked
systems using Motorola smartnet technology down here in the
402-410mHz range. Motorola produces UHF trunking radios as well.
the SP50 can be modified to do trunking, and the P1250-LS is a
UHF trunking radio...

What are you talking about my college has a contract W/ ONLY Coke and we were
being taken for $130 per 20oz bottle and $1 per can!!!!! Coke pays the school
big money to only in return shove it right up the student bodies @$$!
I can see it now for every 5 degree it will go up 20 cents. If its 100 degrees
outside it will cost ya $5. Geeez sounds like the MOB is running Coke?

HI all, I've noticed two different searches stored in my BC 9000. I didn't know this was possible or how I did it. I can be in scan mode and press search and start searching a set of freq. at 12.5 steps. Just a normal search I do. Then go back to scan and press search again, and get this other search I've done before with the same freqs. but it will be in Turbo and at 5.0 steps. It seems to just randomly go to each one of these searches from scan so I can program and store more than one set of search freqs. right. My question is, How can I do this and select which set of freqs. I want to search? My owners manual does not cover this, and I've been under the impression that only one set of freqs. can be stored in search. Thanks for reading and replying to this long post. Rocky. Also thanks for the reply's to Wet Scanner, some time back. I dried it out and it works fine. .....rock56@webtv.net

While being able to adjust the prices might be one use for the antenna, there's nothing to prevent them from doing it now, when the guy goes to refill the machine.

I would suspect a more primary use for an antenna system like this would be to notify the warehouse that the machine is low, and what it is low on. This will allow more efficient loading of the trucks, as drivers would not have to guess at what's been sold. Further, if a machine runs out before the normal stocking day, a special run can be made to restock the machine. I know there's nothing more frustrating than going to a soda machine on a hot day and finding everything has been sold.

Conversely, by reporting inventory the drivers also know when the machine does NOT need to be refilled, and can skip the machine and spend their time more profitably elsewhere. I have a friend who does a lot of consulting work for the soda industry, I'll ask him if he's heard of this.

Source record: 103742

Shiva is correct, but not quite 100% from what I've read, and what I know.

Coke has indeed announced they are 'considering' machines that would adjust price. But from what I read, that is a foreign branch of Coke, and
not associated with the US at all. And in a country that is already EXTREMELY high prices for Coke and Coke products. And has an extremely high energy cost.

I don't think it would go over well here in the US at all.

As to the antennas, I suspect it is inventory management. The local gas company for example saves TONS of money by replacing the meter faces with transponders. Gas vans drive neighborhoods, kick the meters, and read the data that comes back. No more entry into houses, no more appointments... And since gas meters have to by law be replaced every seven years, that's at least one guaranteed battery replacement. I don't know how long they last otherwise.

I really suspect that the antennas are similar, so that machines can be read and 'examined' without stopping unless it is necessary. Depending on how it's set up, the driver may not even have to 'pull in' to most lots for an outside machine. Or he can adjust his route so that he 'drives by' a lot of machines on his way to 'required' stops. Delivery efficiency could see enormous benefits here.

A few years ago I had several addresses for coke machines all over this country and also Australia, don't know how we got the combination of countries and coke machines, anyway, a telnet to them would yeild the time of day, inventory, time of each purchase and a few other things, cna't remember now. It was interesting to us that we could even find them.

For Sale or Trade: Bearcat 9000 XLT Scanner. This scanner has never been out of my home. It comes with the original AC power supply, owners/operating manual and antenna all as shipped from Uniden ($369.99) . It does have the optional CTCSS Tone Board installed ($69.00). All is in perfect working condition. This unit is 6 months old. I have $448.99 into this scanner.

Sell for $325 + $12 shipping "or"

Trade for BC-895 XLT in same condition as BC-9000 + $60. Shipping on trade will will equal it self.

Reason for sale/trade: I'm just looking for a "Trunktracker". Although I am disappointed that I will loose 200 channels, that may be the price I have to pay for the tracking part.

What say you?

WRONG again , Blake!!!

You initially asked for the officers name (who took the report). Now
you want MORE data! We're not going to play that game, Blake!
You call Portland Police Bureau & figure it out yourself. IF you
come up with the CORRECT officer number, we'll all know you
atleast contacted him. Wether or not you tell the truth of your
findings is another matter.

>
First off, the pilots were NOT killed in mid-air. They were on approach to
land and for whatever reason hit some trees and crashed.

Second, it wasn't in Texas. It was in Georgia.

The ISP of the site that caused the problem has contacted me and tole me that they have warned the person to remove the offending page etc. Once this has been removed along with linking I will start work again on putting the site back, unfortunately my site files got damaged during shut off and i will have to re-write over 60 pages again so it may not be for a week or so. (but only if this ass is sorted out first. My site will have in future a referer list so i can keep an eye on what idiots are linking to it so this wont happen again. All downloads will in future passworded so you will have to e-mail me for it if you want to d/load , this is to further make it difficult for leechers.

I just hope this idiot did not want his ham license to much !. also in his country this applies...

Section (s216C(1)
Every person who discloses a private communication which has been intercepted is liable to two years imprisonment (s216C(1)

John, I have participated very little in this newsgroup for over the last year and 1/2 but I have been
watching you.
You are always at the center of fights, controversy and scandals.
Looks like you would rather have negative attention drawn to yourself than no attention at all.
All I know is that wherever John Mackey is there is a fight and trouble and people are getting hurt. Maybe you are on a mission
for good against evil or something but from the outsider's view, you are the bringer of war and chaos.

I think that light planes have special transmitters that turn on if there is a big bump (like a crash) or very hard landing, and I think that transmits on 121.5, but I could be wrong.

This is so if a plane is lost, the CAP can find it.

I tried to put all the possible modifications available up to the date of publication in one place, in a readable, usable way, with clear drawings for each one, plus a lot of peripheral information and easy to build accesories. The other half of the book contains a great many varieties of antennas precisely designed for scanners both mobile and base, including cell phones. They are all easy to build. There are also several helpful appendixes... It's available at all the book outlets. It's written for the low tech, "shirt-sleeve" kind of person, as well as the techie....

Anyone looking for a good deal on a handheld? Selling a Sony ICF-SC1PC, computer controlled scanner with all accessories, software, box & manual. In great condition (i.e. some minimal signs of use). Will include Watson Super Gainer and 800 MHz antennas (the two alone are worth $60-plus) and a Cordura case (not great but better than nothing). Sell the package for $300. I wanted $10 more last week so the deal is getting better!

From Sony's Web site:
msrp $429.95
Bi-Directional PC Interface with Search and Control Capabilities
Supplied CD-ROM contains over 3 million frequencies
Use CD-ROM with PC Interface to Search Frequencies and To Create Files Using a Variety of Search Mode Options
Scans all frequencies allowed by the FCC from 25MHz to 1,300MHz
PLL Synthesized Tuning
300 Channel Memory
One-Button Access To 9 public service bands including Police, Air, Fire/Emergency, Weather, Marine, FM, and TV
Intelligent Active Memory System
Variety of Programmable Features
AM and Narrow/Wide FM Reception
Supplied Frequency Guidebook

This all depends on where you are. I can tell you that all of the RCMP radios I have seen have been Motorola products. Depending on where you are, they may be using analog VHF or Astro digital VHF. As far as the analog radios go, most of the ones I've seen in use have been MCS-2000's for the mobiles. I'm not sure on the portables...

2265. Cell phones becoming scanners

It's unlikely. Most scanner audio outs filter too much out of the signal.
When you get up to MDT bps rates, you need the full output from the
discriminator.

Ron of that ilk.

As long as you don't need an EL larger than 1.7ï¿½x 3.75ï¿½, then I've found a source...

Details on the EL kit are located here:

http://www.microstru.com/ELexp-kit.html

The kit is $22.95 and includes the EL and different color lenses.
If you just want the white EL panel, it sells for $15.95.

For pricing and info on ordering, follow this link:

http://www.microstru.com/EL-Lamps.html

While I haven't ordered any yet, I will this weekend. I saw their ad in Nuts & Volts magazine. I have no affiliation with their company.

To answer Question 1, yes it is
For question two it depends on the Scrambling scheame
if it's simple phase inversion yes and Ramsey electronics sells such a
device in a kit form
if it is Digitally encoded it can also
but you would have to modify
such a decoder they are the same type
that gets the lines, out of pay TV
that can be modified quite easily to audio frquencies.
you probubly have one in the Cable box sitting
on top of your Television.

Not only can they adjust the price, but more importantly they can tell when the machine is empty - or nearly empty - and keep it filled up on those hot days. This system makes use of CDPD and, in my opinion is brilliant.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS

(Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including | a beautiful 11" by 17" scaled color map, protected by | plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association

(RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want
to eat or drink, bring it with you, as well as your BBQ or
six pack.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including | a beautiful 11" by 17" scaled color map, protected by | plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by | replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid | frequency displayed on the readout. This display is | temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

HAMFEST/COMPUTERFEST CALENDAR 1999/2000 - NORTHERN ILLINOIS |
last updated October 28, 1999 |

o Please report additions or changes to Bob Parnass,
AJ9S, office phone: (630)979-5414, electronic mail:
parnass@bell-labs.com. Thanks to Dennis Dale, Rick D.
Wilson, Tom Harker, and ARRL for providing some of the
information.

OCTOBER 1999

Oct 3 (Sun), Wheaton, IL - Giant Computer show (see below).
Dupage County Fairgrounds.

Oct 17 (Sun), Orland Park, IL Giant Computer Show & Sale
(see below). orland Park Civic Center.

NOVEMBER 1999

Nov 13 (Sat), Wheaton, IL - Giant Computer show (see below).
Dupage County Fairgrounds.

Nov 14 (Sun), Orland Park, IL Giant Computer Show & Sale
(see below). orland Park Civic Center.

JANUARY 2000 |

Jan 23 (Sun) - Cicero, IL - Wheaton Community Radio Ama- |
teurs Mid Winter Hamfest - 2000 at the Chicago Motor Speed- |
way. 3301 S. Laramie, Cicero. Located between Central and |
Cicero, between the Ike and the Stevenson. Tickets $5.00 in |
advance with 4 stubs. Free parking. Info: www.w9ccu.org or |
send email to hamfest2k@hotmail.com. |

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of
DuPage, Main Arena of the Physical Education Building Park
Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5
admission with card, normal admission $6.00. Opens 9:30 am
- 3:00 pm. See http://www.computercentralshows.com web
site.

Giant Computer shows are held by Micro Media, Inc. Shows
are usually held at the Orland Park Civic Center, 147th St.
& LaGrange Rd., Orland Park, IL or at the DuPage County

Fairgrounds, County Farm & Manchester Rds., Wheaton, IL.
Admission is $6. Show hours are 9:30 AM - 3 PM. To get on
the mailing list or get more information, call (708)974-
3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer
expo. The event is held on designated Saturdays from 9:30
AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or | through your local Radio Shack store You may be able to | obtain some technical assistance from Tandy by calling | (800)843-7422, option 2.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic

front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is | RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel

Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037

Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable |
Oct 1999 - Uniden Bearcat BC278CLT clock radio scanner |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our

tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset

capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can

be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged

construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in

binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring

Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front

circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner

unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For

tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered

different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate.

Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200

Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells.

Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for

a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to

radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store

feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store.

Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency

stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long

noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF	scans?	lock-outs?
FR104	6	X			no	
FR105	6	X			no	
FR2512	24	X			no	
FR2513	24	X			no	
FR2514	8	X			yes	no
FR2515	8	X			yes	no
FR2516	10	X			yes	yes
FR2517	10	X			yes	yes
FR2525	10	X			yes	yes
FR2526	10	X	X		yes	yes
FR2527	10	X	X		yes	yes
FR2528	10	X	X		yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For

more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a | beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz

"spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Could be a bad connection. Make sure each wire is gently pushed down on each connector. Do the mod or use the display light sparingly so it will last longer.

Anyone have any input on the optoelectronics modelCD100 multicounter?
were any accessories? how would you rate the overall performance of
this freq counter? what about filters? Thanks for your help in advance.

Thanks.

FWIW, I just checked for myself and I'm still receiving San Jose CHP
dispatch on 42.50. I don't hear anything on 42.45.

To calrify the issue even further, if it's on a boat it's referred to as an EPIRB. If it's on an A/C it's referred to as an ELT. All ELT's operate on 121.5 MHz (VHF-AM) and most EPIRBS, in my experience, also operate on 121.5 MHz. The UHF (406 MHz) frequency is definitely in existance and is open for both ELT and EPIRB use. However, few ELT's/EPIRB's have been manufactured to operate on this band. Apparently the intent is to move all ELT's/EPIRB's over to 406 MHz eventually.

I don't know for sure but.... It seems to me that the LCN is something that one would have to experiment with to find the optimum order. Now, let's see..... Midland has 15 frequencies that make up the Trunking system.....I don't do math that well but I would venture to say there are at least a million different combinations to try to find the "LCN". Maybe RS put this radio on the market a little to soon

Blake, your repeated lies need to stop.

First, you know that the reason I am doing "this" is because
of your uncalled for & unprovoked attacks on me & my elderly father.
You have harassed my elderly (& semi-retired) father at his work via
e-mail & telephone per your own admission.

Asking you to stop in the past has done nothing.

You only seem to respond to being publically degraded for your actions
here on usenet.

I have repeatedly asked Blake to stop & offered a "truce" to hims several times. EVERY time he starts up again after a few weeks.

I ignored him for a long time & then he started harassing my elderly father
at his place of work.

Perhaps YOU caould talk to him & broker an agreement wher Blake stops harassing myself & my elderly father.

I'm not sure about the 94 but if it's anything like the BC245 you need to know the LCN order first. I would look for a good reliable source for this information before you drive yourself nuts. Once you've got that, enter the frequencies into the bank of your choice IN ORDER, skipping channels (leaving them blank) if necessary.

There is of course a special procedure for entering trunked freq's and telling the radio that you're entering EDACS (assumption on my part) frequencies. I'm not sure how this is accomplished on the PRO-94 since I haven't seen the manual.

I'm definitely going for the PRO-92 and I might just treat myself to the 94 too if I'm good!

LCN stands for Logical Channel Numbering. Not only do you need to know the frequencies, but you need the right order too. Fun huh?

I would start by doing a little web searching first. Maybe there's a HAM shop in the area that has some info. They may also point you in the right direction to find the best frequency guide book for your area that contains all of this good stuff.

Good luck!

>to 406 MHz eventually.

The 406Mhz versions invariable include a 121.5 transmitter to home in
on. These units are quite pricey, and there is no such thing as a
hand held version. The 406Mhz transmitter also has a GPS receiver, and
put out 5 watts. It actually broadcasts the GPS position to an
orbiting Sat.

The EDACS system in Hampton, VA is constantly having problems. The radio tech's switch the control channel sometimes several times a day to test the system. During control channel changes and being well out of range of the system are the only times I have encountered the problem you are having. Even with interference so bad I can't understand what was being said the 245 usually holds the ID for me.

From: Pepper Hastings <phastings@beckett.com>
Message-ID: <381CA236.BE7CBA21@beckett.com>
Source record: 103478

For an "In Action" photo of these leather cases, see
http://rampages.onramp.net/~peabody/scancase3.htm

I have a handful of these, new in original Tandy packaging.
A flat $10 each includes postage.

Fits the Pro-43, 39, 60, 62 and 64 models. Leather with
belt clip and a perfect rectangular cut out to expose both
AC and charging jacks on the side of the aforementioned
models. Still in the original Tandy wrapper, including
silica package to remove moisture. Tandy introduced leather
scanner cases in its 1997 catalog, which left the 43 and the
39 out. I'm not selling them "as is" or anything, so send
it back if it's not what you had in mind and I'll return
your money.

I accidentally cracked the rear housing on my AR8K. I had the radio clipped to my belt and it got caught up on something and the belt clip and part of the rear housing broke off. The radio itself still works fine. Where can I find a replacement rear housing and how expensive will it be? I can do the repair myself. I just need the part.

Nashvile uses Cellular packet, with S-C-A software. Double DES
encrypted, and impossible for most hobby people to decode.

Brentwood uses Cerulean software, also double DES, but over
an standard radio channel.

Nashville will put 500 units on their new radio system when it goes
online.

It IS illegal, because the ECPA says you can't monitor telephone
conversations unless you are a cell phone technician, ham radio
operator looking for interference, LEO with a warrant, etc.

Of course, there are a lot of things that are illegal that aren't
really crimes, but we've been over that already.

I used to be a regular on this group but got fed up with "Bill Cheek's Big Ego Variety Show", and special guest John "I get no respect because I'm a buttplug" Mackey. There are hundreds of websites, local repeater nets, periodicals, and moderated internet discussion groups that can tell me all I ever wanted to know about scanning, so why bother with this stinkin' flamefest?

I literally have not even lurked this NG for nearly two years. Still, I remember 99.9999% of the folks here being helpful and polite, so I thought I'd try again.

Imagine my surprise when I checked in today and did not find even one post by either Cheek nor Mackey. Are they on vacation? Did they get converted? Did my wish come true and they both spontaneously combusted?

The dialog here seems intelligent and civilized. I know a hell of a lot about scanners and would like to contribute to the group.

Is it safe to come back yet?

Charlie

There were several cell phones that you could place into "test" modes
and many that you could modify to accomplish tasks out of the realm of
operation that they were originally designed to work. The Oki900 was
probably the most hacked cell phone. It even became more capable once
it was teamed with a CTEK cable.

>specific group and I lose the system momentarily, when it resumes
>tracking I go back to ID SCAN. I hate when this happens! ;-)

This is not a "problem" with the radio. It happens when the radio - for whatever reason - loses the data channel momentarily. The radio automatically switches to the search mode, reacquires the data channel, then returns to trunking. However, it returns in the scan mode. This can happen so quickly you'll never see it.
Sometimes it happens when the data channel changes frequency, other times from interference.

You can try www.mouser.com or www.digikey.com or www.amphenol.com.
Mouser and Digikey are electronics parts distributors and they'll
carry Amphenol and other brands of connectors. Amphenol is among the
best, if not the best, manufacturers or coax connectors. Give these a
shot.

You're right, it's called an Emergency Locator Transmitter (ELT).
Upon impact the ELT emits an oscillating tone at 121.5 MHz.

I now receive Golden Gate dispatch at 42.450 mHz instead of 42.500. Does anyone know the background, color or mobile frequency of this new channel? Thanks.

I purchased a PRO-94 3 days ago and am still not able to program the
Midland, Texas PD on a G.E. Ericsson system into this scanner. It
seems that one has to know the LCN, whatever that is.

Hello Netfriends,

I'm trying to identify the chip used in my Uniden BC-3000XLT as the RF receive frequency synthesizer. According to my schematic, it's labeled "M640866P", but I can't seem to find any info about it.
Does anyone have complete info about this chip or at least a manufacturer name? A data sheet would be probably too much to ask for...:-)
In addition, I'd like to get a full partlist of this scanner. If you have a BC3000XLT service manual I'd sure appreceate your help.

Thanks in advance,

T-man

Thanks and best regards,
T-man

Note: when Replying, please email me directly in addition to posting here, so I don't miss any responses. Don't forget to remove the "97" from my email address inserted as an anti-spam counter measure...:-)

MAKING YOUR OWN ANTENNA

BY N1CSS

There are many reasons why you would want to make your own antenna, perhaps you live in an area that doesn`t allow outdoor antennas, Or perhaps the budget doesn`t allow for the latest super - duper stainless steel wonder for 40 or 50 dollars. Maybe you live in a neighborhood where you wouldn`t want to "advertise."

What I am going to describe here is just a simple half - wave antenna, that will give you good reception for anywhere from 20 to 40 miles, that you can build yourself for probably 15 or 20 dollars. (you can probably do it cheaper than that, if you have some decent coax cable lying around). The reason I suggest a half wave antenna is, that radials really aren`t needed. So let`s proceed.

LENGTH OF THE ANTENNA

The length of the antenna will depend on just what frequency band you want to listen to. Most people are interested in the Public Safety bands, which are right around 155 MHZ. You can figure out the length of the antenna for any band with the following formula:

468 / Freq (in MHZ)

This gives you a half wave, in feet and fractions of a foot. Using 155 MHZ as an example, we would come out with:

468 / 155 = 3.019 feet

Now, we can convert the fractional part of the answer into inches by multiplying it by 12 (the number of inches in a foot). This comes out to:

.019 X 12 = .228

.228 is close enough to a quarter inch so it won`t matter. so our antenna will be 3 feet, one-quarter inch long for 155 MHZ.

CONSIDERATIONS

We are going to make this antenna completely from a piece of coaxial cable. Which coax you use would depend on how long the run from the scanner to the antenna will be. If the run is going to be 10 or 15 feet, then you can use almost any coax, since the loss in a short run like this would be fairly insignificant. The idea here is to get the antenna as high up in the structure as you can. You will mount this at one end of the attic, where the

wall is straight up and down. So figure your length accordingly. rg-6 TV coax works well, and is readily available at the local Radio Shack store. Don`t forget to get a connector to convert the screw on connector on the end of the cable to a BNC connector that will fit your scanner jack. Get about 6 or 8 feet of #18 or #20 hookup wire, since we will have to ground the scanner chassis/coax braid in order for this to work properly. Stop off at the local Agway or other yard / garden store, and get a couple of Electric fence insulators, as small as they have, that mount to a wooden post with a nail. However, people with metal - shelled mobile homes and people with metal roofs need read no further, since this will not work with these kinds of structures. I am speaking here of a regular wood - frame building with regular roofing materials. Metal will block out the radio signals. People who live in these will have to resort to other means (of which there are quite a few). I will discuss these in another tome.

CONSTRUCTION

Now, you are going to have to make a hole into the attic somewhere, in order to let the coax pass up into it. Pull the coax up through, and over to where the antenna is going to be mounted. Take a good sharp knife, a small hammer, and a tape measure up with you. A small pair of scissors doesn`t hurt the process, either.
Clip the connector off this end of the coax. You don`t need it for the antenna end. Now, measure down the coax to the point corresponding to the length determined in the formula. If you are doing an antenna for 155 MHZ, I would measure three feet, but nit - pickers and perfectionists will have to get it perfect. We are now going to remove the outer hide from the coax. this will expose the shield braid underneath. You can then push the shield braid down the coax, to expand it and make it easier to work on. Give the shield a "haircut" right at the same point, and slide it right off the end. clip any stray wire in the shield even with the jacket. We are now down to the inner foil shield, which can be removed by just going around it with the knife, and pressing the blade into it, but not hard enough to cut the center wire ! When you have gone all the way around, slide it and the plastic core off the center wire. Your antenna is now finished, so it is time to mount it. Choose an appropriate end stud in the attic, that is tall enough to mount the antenna to, and start one of the insulators in the top. slip the top of the antenna wire into it, and tap it home. repeat at the bottom of the bare antenna wire. do NOT mount the antenna to the roof rafters, at an angle, or you will get very little signal. STRAIGHT UP is the rule here. You`re done in the attic. Go down to the radio end.

THE BUSINESS (RADIO) END

Before we hook up the connector to the radio, we have an important task to do. Look the radio over, and see if there is a screw you can loosen up, maybe on the back of it, that goes into the metal chassis of the rig. This will be your ground point. Take the hookup wire you bought, and strip the insulation off one end for about 1/2 inch. Make a loop, and put it under the screw, and tighten it up again. take the other end, and strip off 1/2 inch of insulation, and go to the nearest electrical outlet. (No, I am NOT trying

to "blow up your radio). The center screw that holds the face plate on the outlet is ground. Take the screw out, and make sure that there is bare metal showing under the screw head. If there is paint, then take the knife and scrape the paint off on the bottom of the screw head. We want a good connection here. Put the wire under the screw head, and tighten it up again. (Don`t overtighten, they strip out fairly easily)

If there is no screw on the radio you can use, or you have a hand - held that you like to use elsewhere, then we use a little different method. We need to ground the shield on the coax instead. If you have a fair - sized needle around, then you can work this under the hide of the coax, but do NOT stick this straight into the coax, as you will short out the coax and undo all your work so far ! Leave about 1/2 or 3/4 inch of the needle on the outside of the jacket, and just wind the bare end of the hookup wire around it and the coax. Some plastic electrical tape would be handy here, as you just tape the wire, needle and coax by simply going around the whole thing for a few turns. The idea is to make a connection to the shield of the coax with the ground wire, as close to the radio as possible.

WHY IS GROUNDING SO IMPORTANT ?

I am sure you have seen the postings on the news groups. "I moved my scanner into the computer room, and all i get is noise on it ! " or "Why does my scanner lock onto empty channels every time I turn on the TV ?" An understanding of just what the shield on the coax does for a living will help you understand why it is IMPERATIVE that you ground it ! The shield of a coax has an important job to do. It is designed to KEEP NOISE OUT OF THE COAX. We only want to hear what the ANTENNA is picking up, NOT the harmonics of the oscilators in the TV, stray RF harmonics of the blower motor in the furnace, RF noise from the computer, etc,etc,etc, ad nauseum. The average home is a hotbed of RF interference.
There is another reason. We carefully cut the antenna to a resonant length for the band we want to listen to, right ? But the fact is, that until you ground the shield on the coax, THE WHOLE CENTER CONDUCTOR OF THE COAX WILL ACT AS AN ANTENNA, UNDOING ALL OUR CAREFUL TUNING AND PRUNING ! This is because, the shield of the coax DOESN`T EXIST ELECTRICALLY UNTIL YOU GROUND IT ! This ALSO DEGRADES THE SIGNAL - TO - NOISE RATIO OF THE SCANNER DOWN TO ALMOST 0 ! This HELPS THE ELECTRICAL NOISE IN YOUR HOUSE WIN ! Remember, some of the interfering signals in your home environment are hundreds or even THOUSANDS of times stronger than the signals you are trying to monitor ! Do yourself and your scanner a favor, and ground the shield. This is especially important if you are running the rig off a wall - wart supply, or something other than the regular 110 volt mains, since you really dont have a ground on those !

THE FUN PART
(OR HOW I BEAT RADIO SHACK OUT OF 30 BUCKS)

Now, hook up the coax to the scanner, and enjoy the hell out of it. You will get solid reception on signals you could barely hear with the rubber duck antenna, and you will hear signals you couldn`t even hear at all before ! The range of the scanner will be increased TREMENDOUSLY. 20 miles is common,

and 30 or 40 is certainly not unheard of ! You did it yourself, you saved money, and nobody is the wiser ! Now THAT is satisfaction ! Settle back with your beer. You earned it !

Based on the 2005, which has the same parts designations, that would be
a current limiting resistor in the 12v supply. Replace it with a 2.2 ohm,
1w, metal film resistor.
It was supposed to give up its life to protect the rest of the radio
from damage, so first find out what tried to short out the 12v line. The
most likely problem would be C229, an electrolytic directly attached to
R229. If it's shorted, replace it with a 2200uF, 25v electrolytic (positive
to R229, negative to ground). Also confirm that you have 12vdc at the
on/off switch contacts.

Anyone out there have any experience with WinScan?

I'm looking at price vs performance.

Is it hard or easy to use? Is it worth the price, Is it available other than by mail?

I'm looking at it mostly to use with a BC295 and BC245.

Thanks in advance.

A couple of months ago Radio Shack discontinued their LCD TV
stand (Cat. No. 16-201) for only a couple of bucks. You might
luck out and find one at your local shop. I bought the two remaining
at mine. ;-)

This stand easily fits a narrow BC245XLT or a wide PRO-34.
The clip on the back of the radios slides onto the back of the
stand, making for a stable setup. It tilts the scanner back to get
a good viewing angle (luck).

Ed,

WinScan was the first 245 software package to hit the market. It had a few bugs initially (to be expected) but the manufacturer was very supportive of their product and fixed all the known issues (at least the ones I know of). It is very simple to use and well worth the money. It isn't perfect by any means. The biggest complaint I still have is the limited useability of the database portion of the program. It doesn't allow for cutting and pasting nor importing of multiple formats. So you had better plan on typing in all the info manually... unless you already have your scanner programmed then you can read the data directly from the scanner. You would still need to add the Alpha tags for all the channels.

There is to be a new version released in March of 2000. If you plan on purchasing it now, I'd push them now for a free upgrade when the new version comes out. More info on the new version at this link:

http://www.strongsignals.net/trunking/messages/45.html

Waldo,

I do not know of any way to look up a cell number (legally).
Unlike a landline phone number which is "yours" (sort of) it is still
owned by the telco. However, they do make your number public (unless
you don't want it as such), and therefore it finds it way into various
databases and eventually subject to reverse look-up.

(Almost) all cell phone numbers are "private" (unless you give it
out)... no doubt mainly for the reason that air time costs someone
money, and who wants some telemarketer calling your cell phone to sell
you useless junk?

Case in point on cell phone look-up... About a year ago, our local
school system had a bomb threat called in on a cell phone. The trace
showed the phone number, but no name. Even a judge couldn't order the
cellular provider to reveal the subscriber without days of red tape!
(The identity was obtained via "other means" and the suspects were
arrested for making bomb threats to schools in several counties via cell
phone.)

If you do find a look-up, please let me know!

...Charlie

2433. New San Francisco Trunked System up and running

Training, brainwashing, whatever you call it. They always ask that. It's
like going into McDonalds and asking for fries. "Do-you-want-fries-with-
that?". "No thanks, just the fries".

EMC207 Answer the Phone? 1/3
To: Emergency Communications Units - Information Bulletin
To: Emergency Management Agencies via Internet and Radio
By: Auxiliary Communications Service (ACS) of the
California Governor's Office of Emergency Services

EMC207 Answer the Phone? 1/3 For release 10/25/99

This bulletin might be titled Opportunity 1a, in that it describes what may be distasteful to some unit participants. Yet, it was a real-world opportunity, quite disguised, but still an an opportunity that is sometimes seldom offered in the life of an Emcomm unit.

A retired Brigadier General and a retired President of a Financial Firm were members of a government EMCOMM unit. The General was a unit Assistant Radio Officer and the President was the Radio Officer for that agency at the time. Both were accustomed to going into the agency to the communications center at least one day a week. While there they usually did EMCOMM unit work of one kind or another, possibly handling a weekly net, checking other equipment, planning unit activities, writing educational bulletins somewhat like these, etc.

While at a government agency Communications Center doing routine EMCOMM unit work, the Radio Officer (RO) received a telephone request from a key Administrative Manager that said: "All my staff are out with the flu except myself and one other person. We need someone to answer the telephone and take the messages updating us on local emergency conditions. Is there a way your people can provide help today?"

As you can imagine, the idea of sitting in an office answering a telephone from people and agencies and writing the phone message is not what EMCOMM unit personnel may consider normal emergency operational procedures. It would have been easy to turn down the request.

What had occasioned the request was a recommendation from a field coordinator who knew the RO and his views on service. He had a hunch that the RO might fill the Managers need, having learned of it earlier, hence his recommendation to the Manager to call the RO.

The RO, still on the telephone with the agency manager, thought "no one in the unit is going to be able to take that on today." Then he realized that the work he was doing in his office at his desk, could just as easily be done at a desk in another agency and he could answer the telephone as well. His thoughts were now "Maybe I could go and provide the assistance. Hmmmn, should I? What might be the long range benefits from that action?" Acting on a hunch, he responded, "Okay, I'll get you someone for today."

(continues next week, bulletin 208)

To subscribe to bulletins, use the Subscription Services web page at <http://acs.oes.ca.gov/subscribe.html>. If you don't have web access, just send an e-mail message to <mailto:emcomm-bulletin-sub@harthaven.com>.

Previous one was last week's newsletter; here's this week's. // Jeff

>Welcome to the Auxiliary Communications Service Newsletter,
>developed by the ACS Training Unit of the State of California
>Governor's Office of Emergency Services. Please visit our ACS
>Home Page at http://acs.oes.ca.gov
>
>The purpose of this weekly newsletter is to bring those of us in
>emergency communications closer together by sharing common
>ideas, and by introducing new technology into the emergency
>services community. All individuals with an interest in
>emergency communications, disaster preparedness or helping the
>community at large are encouraged to participate here in an open
>forum.
>
>You will find a virtual community here, with representatives
>from many different organizations with the same common goal:
>emergency response. We encourage everyone, from whatever
>organization you represent (or just yourself!) to bring us your
>ideas, suggestions, concerns, manuals, handbooks, or opinions so
>that we may share them with the group. To those of you who have
>just joined us, welcome aboard!
> .....
>
>>From the Editor's Desk:
>
>Due to a computer crash, EMCOMM Bulletin #208 got sent out last
>week instead of #207. I will be sending you #207 under separate
>cover. Some ACS files have been lost, mainly those of you who
>have recently signed up; I've lost your biographies for the las
>t 10 days. If you've just subscribed and haven't seen your name
>in the 'Please Welcome' box, drop me a line and I'll include
>you. The ACS Web Page also fell behind due to the same crash.
>I have a new laptop that is substituting for the crippled
>desktop ; the Web Page is now current.
>
>And...no I don't know what caused the crash... I was uploading
>FTP files for the Home Page and I got the Giant Blue Screen of
>Death. It got worse after that.
>
>With the new laptop, I should be able to keep up until I can get
>the desktop's memory transferred to a new desktop.
>

>HDSCS Hams Help Hospitals Handle Hector
>
>The Hector Mine earthquake seemed like a non-event to most hams
>in the Los Angeles area, because few were activated by
>authorities to provide emergency communications support. But to
>one hospital, the temblor brought on a crisis that was made less
>stressful because hams were prepared and acted quickly.
>
>Following established procedures, the Hospital Disaster Support
>Communications System (HDSCS) activated, as it does any time the
>ground shakes in Orange County. Because minutes count when
>hospitals need help, this ARES group doesn't wait for calls from
>health care facilities or governmental agencies. Instead, HDSCS

>immediately checks on the hospitals, gathers status, and
>provides it to Orange County Emergency Medical Service Agency.
>If hospital phones or other communications links fail or are
>overloaded, ham responders discover it and are in position to
>provide immediate backup.
>
>Net control was on the air within five minutes of the quake.
>Thirty-eight members quickly began to assess the condition of
>the county's 33 hospitals. In addition, one went to the radio
>room at the county Emergency Operations Center. (Because RACES
>usually does not activate immediately in these situations, HDSCS
>provides its own operator to the EOC, in accordance with
>established procedures.)
>
>Members provided the first status reports within ten minutes.
>Status of all 33 medical centers was determined within 75
>minutes. At Los Alamitos Hospital, the responding hams (Dennis
>Kidder WA6NIA and Phil Glumm KD6TJT) discovered that commercial
>power had failed. The hospital was using its generator, but
>that didn't power some important diagnostic equipment, such as
>X-Ray and CT-Scan. HDSCS members remained at the hospital for
>six hours to provide backup communications as the facility was
>forced to close its Emergency Department to incoming patients.
>
>Hospital officials were unsuccessful in contacting Edison
>Company by telephone, so WA6NIA contacted Rosie Falcon N3IVO at
>the EOC for assistance. N3IVO relayed the request to county
>officials, who were able to make tie-line contact with Edison
>and initiate a high-priority response.
>
>This event was reminiscent of the Landers earthquake of 1994.
>During the immediate HDSCS response to that temblor, Gary
>Holoubek WB6GCT was first to arrive at Buena Park Hospital,
>where both commercial and generator power had failed, plunging
>the entire facility into darkness. The problem of overloaded
>Edison phone lines was overcome in that case when another ham
>spotted an Edison truck and gave the message to its driver, who
>called it in on his mobile radio.

>
>EMC208 Answer the Phone? 2/3
>To: Emergency Communications Units - Information Bulletin
>To: Emergency Management Agencies via Internet and Radio
>By: Auxiliary Communications Service (ACS) of the
> California Governor's Office of Emergency Services
>
>EMC208 Answer the Phone? 2/3 For release 11/1/99
>
>When the RO arrived at the agency office, the requesting
>manager was quite surprised to discover WHO had actually
>responded to his need, but was pleased to have competent
>assistance.
>
>Assigned a desk, the RO set about taking incoming telephone
>calls. He followed the agency standard process of handling
>incoming reports (messages) (wrote time/date, who called,
>and summary on a tablet.) In addition to responding to phone
>calls he became familiar with each of the various office
>machines the agency had in use (copier, FAX, printer, etc.)
>
>One out-of-the-ordinary call was from a very upset woman
>who had lost her home in the flood and wanted to know "where is
>the money I've been promised from FEMA". When she was advised
>that "This isn't FEMA", she cried "but you are the Office of
>Emergency Services and this is an Emergency!"
>
>Mentally, the RO had a chuckle at her reasoning, and proceeded to
>ask questions and listen. Essentially she'd been going around
>in circles trying to get an answer, but that office was not the
>one able to help. However, he explained WHY it couldn't help,
>and who could and how to reach them. When she hung up she felt
>better and knew where to go because a person sensitive to her
>tone of voice was able to calm her and point her in the right
>direction. Perhaps that was the most important event of the day
>for both of them. It certainly wasn't the typical "radio
>operations" that the EMCOMM unit participant expects from unit
>activity.

>
>That RO was what some could call a "problem solver" and an
>"opportunist". By midday, he'd formulated an idea for improving
>on the data capture process, and asked permission to look at the
>programs on the computer of the person at whose desk he'd been
>assigned. Receiving that, he found a relatively unused program in
>which to create a new INCOMING MESSAGES form. The remainder of
>the day he tested it to ascertain how well it might work in place
>of the then-in-use handwritten form.
>
>At the end of the day, the RO handed that Manager a computer
>generated printout of incoming message activity in the format
>to which the Manager was accustomed. Since it was a Laser print,
>and many times easier to read due to the way it was setup, his
>eyes went wide with surprise and delight at the ease with
>which he could scan the detail. That, and a slightly different
>summary than what he'd previously had received, lead to a hearty
>response, "This is Great. Thank You!"
>

I am wanting to purchase a Yeasu VR500 and is there anyone that can give me some hands on info on this unit? How does it do on shortwave? any info is helpful.
If you have one for sale I may be interested, how much?

Thanks
Gregg
Grand Prairie,TX

2444. Re: harassment by BLAKE BOWERS to the elderly

2448. Re: Question: Airband Antenna

Newsgroup: rec.radio.scanner
Date: 1999-11-01 00:00:00 UTC
From: inigo@montoya.net
Message-ID: <3828053f.6676915@news.earthlink.net>
Source record: 103404

>I'm looking for an airband antena (108-136mhz), for optimal results. Do you
>have any sugestions?
>Where i can find instructions to build a dipole for that freq.?

I used some of the $19 rabbit ears from K Mart and was able to receive
the tower at Kansas City International, Kansas City Downtown and
Johnson County, out on the southwest part of town. I live northeast
of Kansas City.

You might try looking at the low-power FM pages. The FM band is just
below the aircraft band, so the measurements shouldn't be too
different.

One common design is to take the antenna jack -- an SO-239 I believe,
and add a vertical. There are four holes for screws, but instead you
add your radials there and bend them down slightly. You can then
mount it as you would any "professional" ground plane. Or you could
form a tiny bend in the tip of the vertical element and hang it in the
corner of a room, such as from a plant hanger.

2449. FS/T PRO-38

Newsgroup: rec.radio.scanner
Date: 1999-11-01 00:00:00 UTC
From: W8EMS@webtv.net
Message-ID: <20727-381D23D1-81@storefull-122.bryant.webtv.net>
Source record: 103405

PRO-38 200 channel, 800 Mhz, not blocked. This portable is missing the battery cover and a few of the buttons don't seem to make contact. It does program and scan. Sell for best offer or trade for mobile scanner (does not have to cover 800 Mhz band) or ???

E-mail replies appreciated.

I asked this question once before and got EVERY answer imaginable.
Except the one I was asking about in the first place.
So, here we go again!

WHAT are the freq(s) that are used by the Nashville, Tenn. police mdt's ?
And for Brentwood and Franklin tenn as well ?

Thank you,

Johnny

Nashville Metropolition Police Department uses Cellular Packet for
their MDT system.

The service is through GTE Cellular.

This means that the frequency will change, depending on what data
channel is in use, and what part of Davidson County you are in.

is there a scanner that can listen to scramble channels?

if their is which ones ?

2457. Re: need info

Newsgroup: rec.radio.scanner
Date: 1999-11-01 00:00:00 UTC
From: jtward01@aol.com.nospam
Message-ID: <19991101020309.10921.00000813@ng-fl1.aol.com>
Source record: 103413

The AOR 8000 and 8200 can be equipped with optional circuit boards that will allow monitoring of simple audio inversion scrambling as used in some cordless phones. No scanner I'm aware of can monitor the new digital encryption scrambling used by most systems today. Monitoring ANY scrambled communications is a violation of US federal law.

>The main purpuse is to hear the ground station from the airport, 20km north
>from my house.

You need height, not a custom antenna. Airband communications are low power, line of sight communications. Get a $20 groundplane from RadioShack and get it up on top of your house, or even better on a 60-foot pole, and you should be okay.

FCC License Data Sources
Bill McFadden
billmc@agora.rdrop.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-federal-government license in the United States (over three million records). Many of the sources listed contain a subset of this data, although some contain all or nearly all of it. Federal government licenses are not administered by the FCC, and the data is not available to the public.

Also available are subscription services from companies like ISI and CET. Since they charge by the minute, they are not really practical for the hobbyist and hence are not included in this list.

Prices are rounded to the nearest dollar and include shipping, if known.

Another listing of FCC databases has been compiled by Rich Wells at:
http://www.strongsignals.net/htm/fccfrqdb.htm

----- WEB-SEARCHABLE DATABASES -----

You can search the FCC master for free from these web sites:

http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts

http://www.perconcorp.com/db_srch.htm

----- DOWNLOADABLE DATABASES -----

FCC

The database is also available from the FCC for free. It covers most services but not all. Sections can be downloaded, processed with a supplied Visual BASIC program, and viewed with Microsoft Access. The entire database is approximately 3 GB in size. See:

http://www.fcc.gov/oet/info/database/raeddf.html

SCANWARE ASSOCIATES

ScanWare Associates has developed a PC-based database program called the FCC Frequency Retrieval System. FCC data for all states is available, covering all services and all frequencies. However, it is not being updated frequently.

Scanware has chosen to discontinue developing this software, but the good news is that the software and data are now FREE! It is being hosted by the West Virginia Educational Network. See: http://www.wvsc.wvnet.edu/~fcc/index.html

----- PURCHASABLE DATA -----

BETTY BEARCAT

The Bearcat Radio Club sells FCC data in several forms. The Betty Bearcat series of regional directories covers US public service frequencies in 8 volumes. Also available is the Betty Bearcat CD-ROM that contains public service data for the entire US and a DOS-based database search program.

Betty Bearcat directories are $17 each, and the CD-ROM is $27. They are available from The Hobby Radio Stop at 937-299-6440 (info), 800-423-1331 (orders), or http://www.bearcat1.com/scanners.htm.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the US Census Bureau at http://www.census.gov/cgi-bin/gazetteer/. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

CSP TECHNOLOGIES

CSP Technologies sells FCC data on CD-ROM. ScannerBase covers the entire US and comes with a database search program.

ScannerBase used to cost $34 but is now being sold for $4 a copy while
| supplies last! In addition, the newest version, Scannerbase XE, is
| available for free download from CSP's web site. CSP Technologies can be reached at 888-857-4240 (voice) or http://www.csp-tech.com/.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/.

MR. SCANNER

Mr. Scanner offers custom printouts of public service frequencies by county, or the entire FCC master for a city or town. Also available is public service data on floppy disk and a CD-ROM of all FCC data for the entire US. The floppy disks and CD-ROM come with a database search program.

County printouts are $4 each, and city printouts are $6 each. Floppies are $25 for the first state, and $10 for each additional state. The CD-ROM is $37. They are available from The Hobby Radio Stop at 937-299-6440 (info), 800-423-1331 (orders), http://www.bearcat1.com/mrscan.htm (printouts), or http://www.bearcat1.com/menu09.htm (disks).

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com, or http://www.perconcorp.com. The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master. Police Call has been merged with its sister publication, Beyond Police Call, and now includes a limited selection of business listings.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $13 per volume.

PRO DATA

Pro Data is a database manager program for license data. It does not come with its own data but can import data from APF, Percon, ScanWare, and UFDBF database files.

Pro Data costs $60. For more information, write to prodata1@gte.net, or visit http://home1.gte.net/prodata1/index.htm.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. Standard and deluxe reports are available. Both reports include a color plot with transmitter sites marked. The deluxe report adds a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Standard reports are $29.95, and deluxe reports are $34.95. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543; call him at 630-554-3839 between 6-10 PM central time; or visit http://www.megsinet.com/~parnass.

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

I live about 12 miles from a minor airport.
Until I got an antenna up to 60', even with a commercial Aero antenna
I could not hear the radios of planes/trucks or tower on the ground.
But at 60', even a rubber ducky works. I traded off the commercial
antenna, bought a Tandy Diskcone (the early one with out the vertical
element) and can even hear the ground crews on their FRS HTs.
YMMV

You might want to go back to the begining of this thread.
I made the original post(with mispellings and all) before the Lear CRASHED.
At that point it was not over SD.
As soon as the plane crashed I posted an update.
The idea was that, just possible somewhat might be reading this NG that did
not have their TV or BCB radio on. Stupid me, after all I thought this was a
scanning news group.

Dipole may not be all that attractive, as most airband transmissions
are vertically polarized. a 1/4 wave vertical for 125mhz would be
.25 x 300/125 x 39.7 inches= 23.8 inches

For a dipole, each side would be 23.8 inches.

The lower part of the Airband is actually Navigation, not
communications, so you won't find listening to it very interesting

I use a mug with a small block of styrofoam in the bottom. It fits the BC245XLT perfectly and makes it nice and sturdy, while still allowing for the AC adapter to be plugged in. I just pull it out when hitting the buttons, and back in the mug to listen. Works great and is cat proof (the initial reason I decided to use it...). Hope this helps!!

Actually, I popped into my local Radio Shack on Saturday, and spoke with the assistant. He was a scanner buff, and suggested I try one of their telescopic antennas (p/n 20-006A) instead of the standard rubber duck. It cost me $18 Canadian Dollars, and I found it improved things greatly. I no longer have to sit holding the end of the antenna for fear of missing anything that doesn't break the squelch threshold. I may even try their car window adapter, which is a BNC connector on a hook that allows you to attach your antenna to your window and connect it to the scanner via an extension lead.

Thanks,

Richard.

Does anybody have any suggestions for an unobrutrusive base antenna for my scanner ? (to keep the wife happy!!)

Preferably something without a whole bunch of "spiders legs" on the bottom.

If it helps, I like to listen to 136Mhz and below.

Thanks,

Richard.

2478. List of the rec.radio newsgroups

Newsgroup: rec.radio.scanner
Date: 1999-11-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7vki7v$p2r$1@news.hawaii.edu>
Source record: 103434
Cross-posted to: rec.radio.info,rec.radio.swap,rec.radio.scanner

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and its content drifts further and further away from being "on-topic" in the various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6O

I actually just bought a cell phone antenna for it from Radio Shack. Of Course this is only good for the 800mhz region. I have not had much time to test it out compared to the stock antena, but thus far the performance has been pretty good.

I'm new to this "hobby" mainly because Wal-Mart had the above mentioned scanner in a discount bin for litterally nothing. I've been seaching the newsgroups and Dejanews and see all kinds of posts about "Sqelch fixes", "frequency restorers" and other stuff. But I can't seem to find anything particular on this unit. Is there any information about any enhancements or fixes for this particular unit.

Thanks,
-jon

Nope. I still check back once in a while, but it's still going. Only
with Mackey and some others who feed his need. Cheek's gone, probably
forever - but Mackey will always be the common denominator of the
trouble here. Maybe I'll check back in a few months, but for
now.....

Well the broadcasting (air to studio, not air traffic control) side of
things usually falls in the 450-451 or 455-456 MHz range. This is
where you'll hear traffic reports and information being relayed.

> 6.2/6/8 audio subcarriers? This is an important difference.

The Drake SA24 plugs into the back of my sat receiver into the "composite out" jack, (I think, I'll have to look when I get home) and output audio sub-carrier signals from about 5 megs to about 8 megs (again this is from my poor memory), like stereo radio stations; Yesterday USA 6.8meg, TVRO Network 5.8megs, uplinked Shortwave stations, etc . It has presets and a manual tune with several types of stereo decodeing, discreet, mono, etc. You can set the presets for what ever channels you want through a set of internal dip switches and tuning pots. Well built, nice looking, and kind'a fun to play with.... hmmmm.
Hope this ramble helps. ...Jeff

I have a number of P100 UHF transceivers for sale.All with antennas and batteries. Some batteries are not so good and need replacing. I will have possession of all within 1 week

The unit I have now is a P100 UHF, 2 channels showing, channel selector has 14 positions. Battery is weak, no charger with this unit, but has antenna and external belt clip with strap. 9/10 cosmetic condition. Make offer

I will post ALL remaining radios (6 more) soon, they all have batteries, antennas and a few standard chargers.

Just a comment...

These SA-24's are an excellent way to get FM-Squared broadcasts.
Universal Electronics sells an adapter box that fits between your
satellite receiver's baseband output and the SA-24. It then allows
you to use the SA-24 to tune subcarriers between 0 and 5.8 MHz (where
the FM2 transmissions are).

BTW: If you have a 4DTV and want to add a baseband output jack, please
write me for instructions on how to do so.

Another good hidden antenna is one that mounts on the drain vents.
Several ways to go. YOu can slip a piece of pvc pipe of larger diameter
over what is sticking out of the roof and hide the anenna either inside
or outside of it.

Considering the non- technical source, I'd be inclined to think it was either
a typo or mis-information.
Then again... I could be wrong.

It's not a typo. The FCC has a proposal to release TV channels 60-69 for two-way radio allocations. This proposal has pretty much been treated as gospel at the FCC, for now. This segment is being treated similar to the "UHF-T" band from 470 - 512 MHz, which is shared with TV channels 14 - 20. In conjunction with the new DTV allocations and the expiration of all NTSC channels in (roughly) 2006, existing DTV channels could be relocated again for a "second-phase" release of channels 52 and up. I might be a few numbers off... Does any have the specifics/corrections on that?

If I remember right, these new two-way radio services would be exclusively digital, with super-narrow-band channels, spaced on the order of 6.25 kHz. With that in mind, I don't know if I would go out of the way to get a scanner that is capable of tuning 700 - 806 MHz.

But, if you're a scanner nut like me, you'll want to hear what's there, even if it's just digital nonsense. :)

A HOMEBREW MOBIL SCANNER ANTENNA

(Or how I beat Radio Shack out of 20 or 30 dollars)

By N1CSS

Here is a way to make a good home-brew mobile scanner antenna, using an old bottom - loaded CB antenna. The antenna will only be good for one band of interest, since multibanding these gets techinical in a hurry.

The first thing to do is to peruse through your own junk pile and see if you have one of these old CB antennas. You know the type I am referring to , the kind with the big coil at the bottom, and a short whip sticking out of the top. There are a lot of these around, and you can get them dirt cheap, especially if they aren`t working any more. (like when someone tries to use a 500 watt linear on them and burns the coil part out). A burnt out antenna like this is not worth fixing for CB, but makes an ideal scanner antenna, if the whip on it is at least 18 inches long. It just so happens that an 18 - inch whip is 1/4 wavelength in the middle of the most common Police/Fire/Emergency bands, which are right around 155 MHZ. Check your local yard sales.

The idea here is, we are going to bypass the coil in the bottom, and just use the top part (the whip) for the antenna. Look the antenna over, and try to figure out how the coil housing comes apart. Some just unscrew, and then you can finish taking them apart, while others come apart a different way. I will leave this to you, but the idea is to get to the actual coil under the plastic housing, because we have to eliminate it.

Once we have gained access to the coil, we want to look at it, and determine just where it connects to the whip, and where it connects to the center conductor of the coax. We are going to remove the coil, and solder a jumper between these two points. Clip the coil ends with a pair of diagonal cutters, and just unwind it off the form. Now, solder your jumper between the two points. Some #12 or #14 copper wire works well for this. Run this jumper to the center conductor of the coax, if the connection point doesn`t already go there. Take note of how long the jumper is between the two points, as we must subtract this from the 18-inch whip length.

Now, we want to take a look at the ground side of this antenna, usually at the base, to see how the shield braid of the coax hooks up to it.
If your antenna is a Magnet-mount type, you will want to get a connection to the metal housing that holds the magnet, not the body of the vehicle. there is usually some provision for this, a screw or a crimp - type fitting that crimps over the bare shield wire of the coax. Make sure that you have a

good connection to the shield, If your ground is already hooked up, then you can skip this step.

You folks with gutter and trunk - mount type of antennas have to do the same thing, but you are looking to keep (or establish) a connection between the coax braid and the chassis of the vehicle.

In a lot of cases, the ground is still hooked up to the original point, so you can just leave it there.

Naturally , even a cheap ohmmeter comes in handy for all of this stuff, since you can make continuity checks.

Now, cut the whip to 18 inches, minus the length of the jumper you put in the coil housing. Your antenna is now ready to use, except that you will probably want to go down to the local Radio Shack and get an adapter to convert the CB plug on the radio end of the coax to one that fits your scanner.

You can now install the antenna, you mag - mounters just set it on the roof, and others will install in the usual manner for their particular type of antenna, be it gutter or trunk mount type. One tip: non mag - mount types want to have a connection to the metal body of the vehicle at the mounting point. You might have to scrape a little paint to get a good connection, but it sure beats listening to the electric fuel pump on every channel ! By the same token, it is good to mount the scanner so that the chassis has a good ground connection, and this will help with the noise problem. I once knew a guy that couldn`t afford two scanners, so what he did was, he took a needle and worked it under the plastic jacket of the coax at a pretty good angle, so it didn`t short the coax out,but it had good contact with the shield, and then he taped the part left sticking out down on the outer jacket of the coax, leaving about 3/8 of an inch of the end exposed. In the car, he had a short wire attached to the car`s metal body at one end, and on the other he had an alligator clip attached. he could get a ground by just putting his hand-held in the car, and attaching the alligator clip to the end of the pin ! Pretty slick, huh ? In the house, he had a wire attached to the center screw that held the face plate on the wall socket, and the other end was attached to his shield braid on the house coax. One scanner did double duty admirably.

Try this out. What have you got to lose ? An old antenna like this can be had for 2 bucks at a yard sale, and probably for nothing, if you have a pretty good junk box. you could spend the 30 bucks you save on taking the wife out to dinner, and make all KINDS of brownie points !

If you don't mind a tabletop antenna, I've been using an amplified
Radio Shack antenna designed for portable and pocket TV's. The catalog
number is 15-1607 and uses 2 AA batteries or 3 volt plug-in power
supply. It has 2 telescoping antennas which make it directional, and a
frequency range from about 100 Mhz to over 900 Mhz. You need a 1/8th
inch plug to BNC adapter. I've had excellent results with it.

Hello Scanner dudes,

I'm trying to identify the chip used in my Uniden BC-3000XLT as the RF receive frequency synthesizer. According to my schematic, it's labeled "M640866P", but I can't seem to find any info about such a part number.
Does anyone on this newsgroup have a BC3000XLT service manual (with schematics, part list, etc.)?
If you do, then maybe you can help.
Please respond...

Thanks and best regards,
T-man

Note: when Replying, please email me directly in addition to posting here, so I don't miss any responses. Don't forget to remove the "97" from my email address inserted as an anti-spam counter measure...:-)

Great product! Not to much (you don't need a degree in physics to make it work)
and not to little (Track multiple trunked systems with a BC895). Try the
shareware version and see what you think.

It can be had at:

http://www.mghusa.com/pozilla/wsdl.htm

The guys over at Pozilla are extremely nice and knowledgeable on their product.

For Sale: Motorola Saber I Secure - VHF w/Accessories

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=189081427

Model #- H99QX053H
Factory ID - H43QXN7139CN

12 channels
6 watt output
136-150Mhz
SECURENET-S capable
Emergency Button
CTCSS/DCS/PL/MDC600/MDC1200 capable
Radio comes programmed to your specs

Radio Comes With:
Good Medium-Capacity Battery
Antenna
Motorola Porta-Pocket Charger - NTN5563A
Motorola Leather Holster/Case for Medium Battery
RIB Programming Cable
Saber RSS Programming Software (you must have the necessary licenses to use it)

This unit is in excellent shape (10 out of 10 cosmetically) and is guaranteed to be in 100% working condition. All included accessories are genuine Motorola parts and in good condition. Selling because it is not needed anymore. I've been told that this package is worth over $1500! Reserve price is VERY reasonable. Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:

2521. Antenna theory/question? Double the wavelength ?

Newsgroup: rec.radio.scanner
Date: 1999-11-02 00:00:00 UTC
From: Johnny Smith <johnny.smith@home.com>
Message-ID: <pRuT3.2952$Ur4.55858@news.rdc1.tn.home.com>
Source record: 103375

First off, all figures/no#'s here are simply for the sake of
argument.
I KNOW they are not correct. This is entirely hypothetical.
==========

Let's say we want to build a "whip" antenna designed for 155 Mhz.
And let's say the length for 1/2 wavelength at that frequency is exactly
3 feet. Now, I am assuming, that the SAME whip antenna made
made to be a FULL wavelength at the same frequency (155 mhz)
would show MORE gain than the 1/2 right?
So, the antenna at 3 feet would resonant at 1/2 wavelength.
and the other antenna would be resonant at the FULL wavelength.
6 feet in this case. The 6 foot whip would show more gain?
Now, let's take it one step further? What happens if we keep going
with this? What if we made the antenna even longer? Doubling
the length again so that it is now x2 the length needed to be resonant
at the intended frequency? Would the gain AGAIN double? over the
original x1 full wavelength whip ?

That is ridiculous, at least in the 48 continental United States, the cellular provider will give the subscriber information through issuance of a signed court order or search warrant. Both which would take about 10 seconds for a judge to sign. I do it all the time, (I'm a police officer). Not much "red tape" involved in a judge's signature.

> (The identity was obtained via "other means" and the suspects were
> arrested for making bomb threats to schools in several counties via cell
> phone.)

If the "other means" were done without a valid court order or search warrant, then the suspects will go free if they have a lawyer with a first year law school education or better. If a valid court order or search warrant were not obtained, or the suspects didn't give valid permission to release their cellular information, the law enforcement officials have violated their fourth amendment rights under the US Constitution. "Fruits of the poison tree", if the information was illegally obtained, then the whole case is tainted. Besides being taught this in the first week of the police academy, I too have seen this happen because my fellow officers were too lazy to type up a valid search warrant, which takes all of about 15 minutes.

2530. FS:ICOM R1 Unblocked receiver package

Newsgroup: rec.radio.scanner
Date: 1999-11-02 00:00:00 UTC
From: Mike Cooper <coopermj@dca.net>
Message-ID: <xdAeOLv+a9eg0Ll8TU7+pffPqxG7@4ax.com>
Source record: 103384
Cross-posted to: rec.radio.scanner,rec.radio.swap

Items below are part of the package:

Icom R1, unblocked receiver-no coverage gaps-includes cell
Icom BC-72A - drop in charger
Icom LC-61 - carrying case for R1 and BP84/85 battery
Icom BP-90 - battery case with 6 ni-cads installed
Icom BA-12 - charge adapter (will charge internal radio batt with
BC-72)
Icom AD-14 - battery charge adapter (insert onto BP-90 to charge
ni-cads)

Great shape, everything works. Everything in original boxes/packaging

Price: $300/offers
Terms: receipt of Post Office money order prior to shipment.
Package will be shipped Post Office Express Mail (overnight delivery)
included in price.

No CODs, please

Inquiries: Mike Cooper
coopermj@dca.net

>original x1 full wavelength whip ?
>
>
A complete (or even reasonable) disccusion of antenna theory and practice is
way too envolved for a news group thread. Having said that I will jump right
in. The problem with just doubling the length to get more gain is the feed
point impedence and radaition pattern undergo "wierd" changes. To keep it
simple, by going form a 1/4 wavelength to 1/2WL the impedence goes up. Way
up. not if you increase the length to 3/4, 5/4 ,7/4(note ODD quarter WL
pattern) the feed impedence will remain close to 1/4WL. But with increasing
length the antenna lobes will "fold" in the direction of the antenna away
from the feed point. This is great for a horizontal antenna, that you can
build facing the direction you want to communicate, but not so good for
vertical antennas (unless you want to send your signal straight up).
How much differnce does this make?, Well I have used a 10MTr 1/4W vertical
on 2mtrs and, while the SWR meter show a good match, I could not bring up
repeaters that I can easily reach with either 1/4WL or even the rubber ducky.
The ARRL Mobile Antenna book(from 1957) showed a nice trick of putting
an insulating tube over the antenna and putting 1/4WL braid to convert that
1/410MTr vertical into a co-phased vertical and that trick works great.
(of course it makes that 10mtr 1/4WL vertical look kind of wierd...)
Now who wants to explain why a matched 1/2 or 5/8 vertical outperforms a 1/4

vertical and how to match it to the radio? And by outperform I mean it will put a much stronger radiation pattern down on the ground where it is needed, unless one is trying to reach airplanes or satellites.

Not to nitpick, But I am guessing that the Drake SA24 takes L-band RF (940-1500) from a LNB/LNC and demods it to baseband video and audio, or does it take the unfiltered baseband from a receiver and demode the 6.2/6/8 audio subcarriers? This is an important difference.

Source record: 103387

Johnny, your hypothetical thinking is good as far as it goes, but there are two additional factors you need to consider: impedance matching and directivity.

On a given frequency (say 150 MHz) a vertical whip that is any multiple of 1/4-wave (18") long will be resonant. Resonant means having only a resistive component of impedance, not a capactitive or inductive component. Non-resistive impedance will cause signal loss due to impedance mismatch, unless a matching circuit is included in the design to neutralize that component of impedance.

A vertical whip that is an *odd* multiple of 1/4-wave (18", 54", etc. etc.) will have a resistive impedance near 50 ohms, but a vertical whip that is an *even* multiple of 1/4-wave (36", 72", etc.) will have a much higher (500-1000 ohm) resistive impedance. Any resistive impedance very different from 50 ohms causes signal loss unless an impedance transformer is included in the circuit.

Any antenna shorter than 5/8-wave will have a single lobe of directivity, but any longer antenna will have multiple lobes dividing its gain between lobes. The rule of thumb is that an antenna will have one lobe per 1/2-wave of length.

Applying all this to your hypothetical antennas of increasing length:

A 1/4-wave whip will have a good 50 ohm impedance match and a strong single lobe. This is excellent performance and is called "unity" gain, or 0 dBd gain.

A 1/2-wave whip will have poor 1000 ohm impedance mismatch and a single lobe. With an impedance transformer in the circuit this can provide about 4 dBd gain but, without a transformer, impedance mismatch causes about 20 dBd loss.

A 3/4-wave whip will have close to a 50-ohm impedance match, but two lobes -- one angled at an upward angle and one angled at a downward angle. This is bad news. It's nearly deaf to signals coming from the direction of the horizon.

A 1-wave whip will have both poor impedance match and split lobes. A double loser.

A 1-1/4 wave whip will have good impedance match but poor lobe pattern.

A 1-1/2 wave whip will have poor impedance match, but now a third lobe appears, directed at the horizon. So this length can actually deliver a signal from the horizon, but with lower sensitivity than a 1/4-wave whip.

etc., etc., until you get to:

A very-very long (multi-wavelength) whip will have an impedance of about 300 ohms, for an impedance mismatch loss of about 10 dBd unless a transformer is used. But it will have nearly all its lobe sensitivity in the direction of the two ends of the antenna, for tremendous gain straight up and straight down. This effect can be used to great advantage in other antennas designs, but not for a verical whip.

If you're interested in learning more about antenna theory, I recommend the "ARRL Antenna Book", which should be available at most libraries supported by their local ham communities. You can look up this and other antenna books at ARRL web site at http://www.arrl.net/

Keep thinking, Johnny, antennas are great fun!

I have for sale a beautiful condition Icom R-10 with the orignal box, manual, antenna, recharger/adapter and Nicads. The radio is 800 Mhz blocked, but can be modified. I'll include the info on how to do this, but will NOT do it myself. It is a 9.75 out of 10 condition. I'm also including the PC serial interface cable, which is another 45 dollar value, and the programming software.

Shipping is also included, all for the price of $250.

>> found coaxial dipoles and other variation to be a lifesaver.
My folks live in a gated (and very restrictive) communitiy. Dad is a causual SWL. He put a rat shack diskcone in the attic for scanning and we carefully checked his guttering, soldered all the seams(it is copper), and descreetly tapped it to use an upside down u for a SW/Ham antenna. The TVI is worse than I like, but he is happy.
He only operates during clear, non storming weather, and grounds and disconects when not in use.
Stealth antennas avoid all sorts of disputes with the locals over TVI, messed up microwave ovens or even fallen bread (a fellow ham was served with legal papers that alleged his radioactivies {pun intended} causes the woman next doors bread to either "fail to rise or to burst and collapse". He contacted a local judge, who was also a ham and the whole mater went away, with Ms. BreadMaker getting a stay for observation.
The whole world was against her. She was truely ill, not mean.

>
>
>
The fact that as the frequency cahnges so does the wavelength/impedence
is why on my SWL antenna (a 100 foot ""LONG"" wire) is coupled to my coax via
a remote controlled antenna tuner/matcher. If you can get really long
several 10's of wavelengths or longer, the pattern comes
off the end of the antenna tighter thatn most beams. Of course for say 1MHz,
where a wavelength equals 300meters that is a really long antenna.
At 10MHz, where the WL is 30Mtrs then an antenna 300mtrs long will be almost
doable. I have used an improvised 1000' antenna point straight
at WWV to pick up WWV on 10MHZ (and 15 and 20 and even 25 back when the
NBS used that freq) even when the bands where "dead". But I was at a frineds
farm, and his dad let us string the wire out in the dead of winter. While
good for demonstration, this type antenna is not of much use to most of for
most frequencies. There are better, shorter antennas
such as the Rhombic Which can easily be used at frequencies of interest to
most scanner buffs.
And I am afraid that while your commnets as to why a 2Mhz antenna and a
800MHz antenna while correct, miss what I was trying to show, while 1/4WL
verticals are easy to build, a halfwave vertical has a much better, that is
for ground to ground, omnidirectional communications, antenna pattern. The
1/4 has most of its energy going up at (about) a 45 degree angle, but the
half wave pattern is almost 90 degrees, straight out, from the antenna.
And a 5/8WL has even more gain than a HW, but the 5/8 and the 1/2 WL have
wierd feed impedences and require "exotic" matching that really limit the
useable BW. While a 2mtr 1/4WL vertical, at 19.25", rapidly losses
effectiveness for transmitting, you can still receive signals from CB (27MHZ)
through Cellphones (or even microwave ovens at, IIRM, 2.4GHz). But with a
5/8WL you can not even receive the local college station at 88.3MHz. But the
5/8WL is great for 2mtr mobile communications. My 2mtr HT has about 3 times
the range with the 5/8 that my 80watt mobile does on a 1/4WL. And someday I
will expalin why (and how) I get away using a 800MHz trunking antenna (NOT
through the glass) for 146, 440, cellphone AND scanning. Hint: look at
cell/800trunking antennas and think about the 4 turns in the "middle".
As a retired USMC DI says"If it works it ain' stupid". All of my main mobile
antennas have the Motorola/Larson MNO(I think)mount so I can switch from one
to the other (except in ice storms) with great ease. I also have a base

loaded CB/10MTr antenna. I even have a military "folded" 5/8s base to MNO? adaptor so I can put up a 15' antenna on my car roof for serious SWLing. But you can not drive with that one up! I use the cell/trunking antenna because no one pays any attention to it. A roof full antennas attract way to much attention these days. Even a 1/4 ham antenna get you second glances.

Thanks, I thought it might be an outboard baseband FM demod unit.
Have you ever connected a SW to the bassband output(use a capacitor to block
any dc spikes, a friend popped the front end on his Sony portable!)? There
are all sorts of SSB/FSK/FAX signals hidden in there. OR at least used to
be. I have not played with a sat dish in several years.

about the BC-855XLT:

>Everything appears to work with it fine, receives well and everything.
>I have one problem....the scanner does not put out any audio what so
>ever. Neither through the internal speaker or an external speaker when
>plugged in.

Just curious. How did you determine that it receives well
if it produces no audio?

>Has anyone else had a similiar problem with this scanner? Can I fix it
>myself? Is it something simple like a component being bured out such
>as a resistor, diode, or capacitor?
>

1) check the integrity of the external speaker jack.

2) connect the center contact (wiper) of the volume
control to the input of an external audio amplifier
through a short cable. Use a series cap to block
any DC.

This will determine if the scanner's audio amp is being
fed audio.

3) then, check for a bad electrolytic capacitor in series
between the external speaker jack and the scanner's
audio amplifier.

>I'd really like to fix it myself.

If you don't understand the instructions above, or
cannot repair the BC855XLT using them, then you'll need
a schematic diagram.

In that case, leave the repair to professionals.

> UNIDEN wants $50.00 to repair it,
>and I'm sure it's something simple.

The $50 fee is not unreasonable.

True, but Coke is an enabler. According to the report, they would be
the ones making the machines with this high tech gouging capability.

BTW, if someone can tell me the exact coordinates of an
antenna-equipped Coke machine, I'll be happy to pay it a visit with my
Opto Scout and find out what frequency it's using. ;-)

What's this? Did I hear my name mentioned?

Define LOOONNNNGGG, John. One day or maybe two days? How long is LOOONNNNGGG to you? Is it as LOOONNNNGGG as your nose, Pinnochio? I've gone for MONTHS without even acknowledging that you exist.

Define here. Here as in a.f.j.m. where this sort of thing is the accepted topic, or in a.r.s., r.r.s. r.r.a.m. and countless other groups you crosspost it to? Don't you see you are to blame for taking threads from here and place them where they don't belong? No of course you don't. You're peer policing, right? Yeah. Sure. I most certainly am NOT one of your peers John.

> Perhaps you should wake up!

Perhaps you should embrace the truth that you need help in the worst possible way, pal.

So far both Glenn and Blake have done an excellent job of making you dance like the puppet that you are, with no assistance needed from me. I don't even know why I was mentioned in that list. I don't get it.

But now that you mentioned me so nicely, I'll take this opportunity to ask something I've wanted to know for years: Why is it that you attract attention to yourself and then beg everyone to leave you alone? Why is that?

WTB: Motorola Saber I - VHF

I'm looking to buy a Motorola Saber I, VHF. Radio must work in minimum of 148-162Mhz and must come with antenna. Would prefer it to come with charger and battery but not necessary. Ideal radio would be a Secure capable radio (module not needed at this time) with an emergency button, but also interested in non-secure radios as well.

Please email PDFDISP@aol.com with what you have and how much you're looking to get for it.

Thanks!

The most unobtrusive outdoor antenna is probably the Ventenna. It mounts on the roof onto a vent pipe and looks just like a vent pipe. So when you are done, it just looks like a vent pipe sticking up about 3 feet.

I have the antenna shown in the link below, and because it takes a mast pipe to mount it to, it looks like a big 'H' on the roof. No too stealthy.

I have only tried the stock Icom program under both NT3.5 and 4.
It worked but was buggy (even for the Icom software) beyond belief.
I bailed at that point and dropped back to Win95. But other
applications also acted wierd on that PC and I was never convinced that
it did not have a bad hardware disorder. Was not my machine and the
data geeks(SM) took it away one day.

They both work. However, it may be necessary to turn off FiFo buffering on your COM port settings. The software for the PCR-100 is newer, and designed for Win95/98/NT, where the software for the PCR-1000, is an earlier vintage, primarily designed for Win3.x, but it does work in other environments. There are third-party software options to consider also!

I've heard some very interesting comms recently on one of the Peel Regional Police (Ontario, CA) talk groups (Motorola Type II trunked 800 Mhz). During what appears to be surveillance (tailing) ops the officers use some very unique jargon terms in their commos. I quote as follows (my guesses in brackets)... does ANYBODY know what these terms mean?

"1 (or 2 or 3 or more) shades" [cars between subject and follower?]

"I'm Greek to you", "He's Greek to me", [?]

"Thirty (or forty, fifty, sixty, etc.) cents on the table" [??? guessing cars in immediate area for camouflage?]

"Taking an L-Bender (or R-bender)" [left or right-hand curved turn...?]

"Moscow" [stoplight?]

"Stopped at a Kelly" [stoplight or stopsign?]

"I'm in the hot/cold track" [left/right-hand lane?]

There are a few others; I may post them when I get a chance to write them down. Am very interested in learning what these terms are, AND please post any known Halton/Peel/Toronto Metro 9 and 10 codes, too!

Thanks,

Steve

Just received the new Radio Shack flyer, #581...

The brand new PRO-94 (#20-524) is on sale already, for $199.99, $100.00 off the regular price of $299.99!

1000- Channels
Dual-Trunking
Motorola I, II, I/II, and GE/Ericsson (EDACS) trunked systems
Built-in Weather Alert
Runs on 4-"AA" batteries

While it's know that this radio is lacking, when compared to the PRO-92, at this new price, it may be a consideration for many scanner enthusiasts.

ICF-SC1PC, handheld in great shape; hasn't been used much. Includes all accessories, software, manuals and box. Also will toss in Watson SuperGainer and 800Mhz antennas and a Cordura case (that's almost $100 worth of stuff right there). Sell it all for $290 with shipping.

Here's info from Sony's Web site:
msrp $429.95
Bi-Directional PC Interface with Search and Control Capabilities
Supplied CD-ROM contains over 3 million frequencies
Use CD-ROM with PC Interface to Search Frequencies and To Create Files Using a Variety of Search Mode Options
Scans all frequencies allowed by the FCC from 25MHz to 1,300MHz
PLL Synthesized Tuning
300 Channel Memory
One-Button Access To 9 public service bands including Police, Air, Fire/Emergency, Weather, Marine, FM, and TV
Intelligent Active Memory System
Variety of Programmable Features
AM and Narrow/Wide FM Reception
Supplied Frequency Guidebook

It happens to be one of the best you can buy; it's not a scanner in the true sense of the word--more like a wideband receiver with scanner-like features. The price is nothing special. Everyone sells them for $1400-$1500 (at least the dealers who actually care about selling one!). Check around for competing prices. You might do better (I think Burghardt is good; they have a Web site; I don't have the URL buy you can find it at the www.strongsignals.net Web site,

The Icom has great ergonomic features; big luscious knobs, bright readout and really great performance. SW is terrific. Only thing about this one and similar high-end units like the AOR5000 is the damnable clicking relays. Hate that noise; too slow too for serious scanning. Oh yeah, software pretty much sucks.

On a slightly related note.. Be careful of "800" numbers. Some people don't realize that caller info is compiled by owners of toll free phone #'s. At one time I had a home based business and had an 800# on my second line. My monthly bill included ALL the #'s of the incoming callers! Phone providers reverse the charge, and the distances are "banded", meaning they bill just like long distance calls. Owners of the 800 # can compile the "incoming" caller info for reporting purposes (i.e. calling patterns, etc) Sooo, even if you call an 800# and hang up after 1 second, don't be surprised if your phone # ends up on a sales or prospect list!

Hello Currey,

No offense taken with your posting.

Spread Spectrum is the way to go. With a direct sequence spread sprectrum phone, this is what basically happens (simplified):

You handset audio is digitized and then spread by a pseudo random digital code sequence. The signal that is generated is many times wider in bandwidth than your original voice signal. If you listen to a spread sprectrum signal on a scanner, it sounds like noise.

Your phone base knows the handset pseudo random digital code sequence and correlates the incoming signal (matches the phone base code with the handset code) and this leaves you the digitized audio. Runs the digital audio through an D/A and out comes audio.

You might want to know that spread sprectrum has been selected as the next generation standard for cellular telephones. Using code division mulitple access (CDMA) many cellular phone users can use the exact same RF frequency at the same time -- each user has a different pseudo-random sequence code -- there are codes that do not interfere with each other. Allows greater capacity in the cellular system when compared to Analog, TDMA, GSM. CDMA technology is used by the major cellular companies -- the patents are owned by Qualcomm, Inc of San Diego.

I replaced the lights in my Yaesu mobile with bulbs found at the shack. I measured the voltage at the bulb, look through the shack catalog until I found the same bulb and voltage. If you expect the shackt to tell you what bulb the 760 takes think again, it won't happen. When going to the shack it is best to go educated and with the part number if at all possible.

BTW, get rid of the ALL CAPITAL LETTERS. HIT THE CAPS LOCK OR YOU WILL LOOK LIKE A CLUELESS NEWBIE, FEEL EMBARASSED FOR 30 SECONDS AND THEN REALIZE YOU AREN'T BLEEDING SO YOU TURN OFF THE CAPS LOCK and now you look like everyone else. :-)

While on vacation recently in Ocean City, Maryland, I read an article in the newspaper about the town trying to decide which type of radios to buy to upgrade their system. The article mentioned two types, one of which would be compatible with a future statewide 700 MHz system. Does anyone know any of the details of such a system? Will it be analog or digital, trunked or not, etc? Is it worth buying a full coverage scanner to possibly monitor these freqs? Or was it a typo in the paper? If anyone has heard anything about Maryland's or any one elses future system, let me know or point me to a link with the info.

Thanks,

Dan

You are wrong. It is part of a new plan for public safety that has allocations for mobile data, voice and other types of communications.

I don't know of them, but I've heard rumors that even more upper UHF
TV channels (unused) are going to be reorganized. That *might* bring
it down to 700 MHz or so. Can't remember the details.

Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,sci.electronics.components,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner,rec.radio.amateur.equipment

Hello again,

Well, after hard work (and the help of Chip directory,
http://www.hitex.com/chipdir/chipdir.html) I managed to idetify this
chip as a Mitsubishi part. I've even found similar parts with almost
identical partnames (+/- one digit...) even with several identical pin
names, which means I'm on the right track...
Reminder: this is a 20pin SSOP chip, RF synthesizer with serial input.
I need the full data sheet to program it.
So, is there anyone on this newsgroup with access to a Mitsubishi RF
catalog or other info source, to help me get the full data sheet
(better yet, to give me a pointer to a web site with proper PDF file)?

Thanks and best regards,
T-man

Note: when posting a Reply, please send me a copy
via email too so I don't miss any responses. Don't
forget to remove the "97" from my email address
inserted as an anti-spam counter measure...:-)

This is not to be taken as a flame but he didn't mention anything
about listening to it himself, but rather if IT CAN be monitored.
Which is a good question, since I just purchased a Uniden Digital
Spread Spectrum cordless phone myself. The reason I got this kind of
cordless phone is I understand it is not possible to have some one
ease drop on you. Since I have a scanner and know how easy it is to
listen to cordless phones, I wanted one some one couldn't be listening
to me on.

Long explanation, short version.

Any odd multiple of an anteenna will produce 'gain'.

Which is why 5/8ths is such a popular number. Approx 3db gain without
excessive length.

The real question is how long will it take until some kid figures out
how to control the signal on the coke machine. Then you can walk
up to the machine with a little transmitter and knock the price down
25 cents.

Here's a tip for you: If you don't want people listening to you, then
don't "broadcast" your conversations through the air!!! Use a corded
phone and you won't have to worry about it.
The answer to your question is yes, there are people out there that
are smarter than you and the telephone manufacturers and can bypass
this "security" measure even though they are far and few between!

I just purchased a Uniden Digital

Thanks for the info! I used to get those signals by using the 70 meg output and running it into my R7100. I also remember using the FM mode on my R5000 shortwave receiver and feeding it composite video (?) into the antenna which allowed me to pick out those signals but the narrow bandpass of the R5000 made for pretty rough copy. All kinds of interesting signals down there. At the time I was interested in the GOES wefax on one of the transponders, but now I use a modified LNA, dish, and the R7100. Well if it doesn't sell I'll have to look into the adapter!

> A complete (or even reasonable) disccusion of antenna theory and practice
is
> way too envolved for a news group thread.

And very possibly WAY TOO "involved" and "evolved" for MOST of the
people reading the newsgroup as well.

>The problem with just doubling the length to get more gain is the feed
> point impedence and radaition pattern undergo "wierd" changes.

Heh, it surprises me that you made the above statement.
Although I admit that I was NOT aware that the radiation lobes changed
when the length of the elements changed... I DID know that the impedance
did. Having read this newsgroup for years now, I have often been appalled
by the number of so called, "experts" claiming that impedance mismatches
in the antenna and the line were simpy "irrelevant", and meant NOTHING
when receiving. So, while I am on this, I'll state again... a MISMATCH
IS a MISMATCH regardless of whether the source of power is originating
from the antenna, or originating from the radio transmitter. When the
power
comes across a change in characteristics of the medium it is flowing
through,
some and/or ALL of that power is reflected BACK to the source.
So anyways, I am complete agreement with you.

> To keep it simple, by going form a 1/4 wavelength to 1/2WL the
> impedence goes up. Way up. not if you increase the length to
> 3/4, 5/4 ,7/4(note ODD quarter WL
> pattern)

Also, I should add, that simply changing the freq' being sent TO
the antenna will change the impedance the radio "sees" at the antenna.
(and I believe reactance and resistance changes as well)

> Now who wants to explain why a matched 1/2 or 5/8 vertical outperforms a
1/4
> vertical and how to match it to the radio?

Well, I can only explain from a receiving point of view.
The answer is simple. Physical SIZE! To "loosely" quote
from the ARRL Antenna Handbook, "a dipole cut to resonant length to
operate
at 800 mhz, (very small elements involved here) WILL radiate JUST
as efficiently as a dipole cut to lenght so that it will resonate at 2 mhz.
However,
due to the differences in length, the 800 mhz dipole WILL NOT extract

anywhere
near the amount of energy from the air that the 2 mhz will. Simply because
of the
differences in physical size".

Don't just look at the antenna....If you're listening to that high a frequency you also need good coax. Use 9913 coax with silver connectors. Your signal loss will not even be noticeable. Try to use a discone antenna if you can, outside is better, but that may be a problem for you. You can also boost your signal by getting a GRE super-amplifer at www.grove-ent.com The amp will work real well if you have one of the better brand scanners such as an Alinco. The Radio Shack scanners sometimes get more "fuzz" instead of a nice clear signal with the amp. If you can fit a discone antenna in your attic, that would be better than a plane antenna, although that would work well but I think it might be directional.

Message-ID: <38211A08.7C1E6434@globe-net.net>
Source record: 103150

One thing to keep in mind about this new spread spectrum technology
(developed back in the 40's), is that while conventional scanners
will not likely be able to be modified for reception of these signals,
there may be alternative ways of receiving the transmissions. There are
numerous hacks of cell phones on the www that puts the phone
into a "test mode" and allows reception of all channels. Not
saying that such a mod exists for a spread spectrum phone but if
I were to hypothetically want to receive such signals (got better
things to do...), I wouldn't be looking to hack my scanner but rather
a spread spectrum phone.

Remember, hackers enjoy a challenge. There is no such thing
as "can't" but "not likely" is more reasonable. If someone was
serious about monitoring your conversations, they'll do it. Whether
it be through a scanner mod or by ordering a laser microphone:

http://w972.com/spy/spy355.htm

As a rule, I never discuss sensitive information (credit card numbers, etc.)
on wireless communications. All else fails, get a Maxwell Smart Cone of
Silence. ;-)

Rich Well's has excellent online reviews of many scanners. You
might want to check at his website:

http://www.strongsignals.net/htm/radios.htm

The BC760XLT and PRO-2026 are both made by Uniden are
are very similar. The bulb used is rated at 5.0V and is a T-1
base (0.125"). While I couldn't find it listed in the standard
Radio Shack catalog (only had a 12.0V version), I did find
a suitable replacement in the new RadioShack.com catalog.
You can visit their online catalog at this link:

http://www.radioshack.com/

Look up Cat.#: 900-2615
The price is $1.19

While you can't presently order it online (their system is
hosed up... already sent them e-mail to fix it), you can
call 1-800-THE-SHACK to order it.

You will need to unsolder the old light and attach wires to
the new light. You could order a replacement from Uniden
that already has wires attached but you can bet it will be more
than $1.19!

Hope that helps,

Robert

Here's more info on the 94. Shame the 92 isn't offered
with a 1000 channels as well (greedy, eh?):

Radio Shack PRO-94
Handheld unit made by Uniden
Track Mot & EDACS
1000 channels w/20 banks
Freq range: 29-54, 108-174, 216-225, 380-512, 806-960, 1240-1300 MHz
S.A.M.E. weather alert
Service Search w/police, fire, weather, aircraft, marine and ham
4 AAs
Price: $300

Robert

Fred Zalupski wrote:

Radio Shack has a 6V bulb that fits the orange grommett (on the 2026)
perfectly.

You need to splice the wire rather than go directly to the pcb because they
are too short.

They come 2 in a package. Sorry....don't have a PN.

At least they are getting a little smarter about it (corporate-wise) -- they now have "suggestive-sales" prompts on the point-of-sale computers that list items to suggest to the customer as each item is scanned or entered. If you buy a piece of equipment, usually it prompts for extended warranty, for example, as well as batteries if the item uses them. They're getting better at that. Granted, it lowers the IQ required to be a Radio Shack salesperson, so that anyone with a third-grade education can probably qualify. (OK, so say it -- that was the requirement before!)

Very true. Also, a judge would be very willing to sign the court order given something as serious as a bomb threat.

Also, I read on the net that 1998 was the first year that more cell phone than land line phone taps were ordered in the US. So judges are not "afraid" to act on cell phone crime it would seem.

From the FAQ article REPAIR TIPS: BEARCAT SCANNER RADIOS:

[...]

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are
illuminated by "grain of wheat" type incandescent bulbs.
Gary Saffer reports that the bulbs and buttons are located
on a small printed circuit board which sits behind the
radio's face plate. Gary unsoldered the burned out bulbs
in his radio and replaced them with 12 volt Radio Shack
bulbs (#272-1092c). They should last a long time when
powered by the 8 VDC supplied by the BC760XLT.

There seem to be a number of different manufactures that have an
antenna they call a "discone". Radio shack has one, Icom has one,
Diamond has one, etc. Are any of these "better" than the next?
"Better" could mean better RF performance _or_ build quality, et
cetera.

Also, how do these discone antennas compare to the Channel Master
wideband scanner antenna with the funny looking "pitch forks"?

Thanks in advance,

-

Can anybody point me to a website listing scanner reviews ? With all the scanners available on auction at Ebay, it would be helpful to find out which are any good prior to bidding.

Cheers,

Richard.

Most of you already know the Radio Shack PRO-2050 (#20-430A) desk-top scanner, is currently on sale for only: $179.99. This was listed at: $299.99 in the 1999 catalog! It is manufactured by Uniden, for Radio Shack. It is a 300-CH, triple-conversion, Trunk-Tracker, (Motorola Type I & II).

I had an opportunity to spend some time with it, and it is a very impressive scanner, especially at the sale price!

I pretty sure Diamond makes the one that Icom markets. The only difference, the Icom one comes supplied with the type "N" connector, the Diamond, and the Radio Shack versions, are supplied with a PL-259, as I recall. The quality of the Radio Shack seems very similar to the Diamond, and is either a good clone, or possibly manufactured by Diamond as well. The best buy appears to be the Radio Shack model.

You can view both types...

Discone style: http://www.grove-ent.com/ANT9.html

Pitch fork style: http://www.grove-ent.com/ANT7.html

This discone is a very sturdy design, and can double as a suitable transmitting antenna, at certain frequencies. I have heard that the "pitch fork" style, may perform a little better. The Grove Scanner Beam is another consideration! If you're not familiar with it, check it out... http://www.grove-ent.com/ANT1.html

Some general thoughts:
Diskcones are wide bandwidth no gain antennas.
I have friends who have (between them) had every diskcone known to man.
As a general rule, the true diskcones, the ones without the vertical element are best of over all receiving. The vertical (aka "stinger") is supposed to help the diskcone act as a decent Transmit antenna for either 6mtrs(50-54) or in some cases 10Mtrs(28MHz). While they do help slightly, a simple 1/4 ground plane, or even a coaxial dipole will out perform them and can be built for free.
The ARRL antenna handbook used to have plans for a homemade, from 1/4" screen, diskcone that will cover a 10:1 (100 to 1000, 50 to 500 or 140 to 1400) and also be used for tx. I have the first tandy diskone and, given that it is a no gain antenna does a great job. Much better than any single frequency antenna for covering a wide frequency range. But if you are mostly interested in one frequency there are better ways to go.
I have directly swithced between that "funny" channle master and the diskcone and while the CM is slightly better at some freqs, the diskcone is better for overall reception.
It boils down to what do you want to listen to. Given that in my case I

monitor from DC to light, I want as few antenna as I can get by with. For special projects I will build and use a special antenna, but for day to day operations the diskcone is the best single antenna that I have found.
YMMV

WTD: Key West and Monroe County Frequencies

WTD: Key West and Monroe County Frequencies

I will be visiting the Florida Keys soon and wanted to gather some frequencies for there.

Anything from the Naval Air Station; air or ground to local/state police frequencies are desired.

With Cuba only 90 miles south; is there anything receivable from the island with a handheld and a good base antenna? No hablo espanol but it might be interesting to give a shot at it as I noticed the Navy base has a lot of antennas pointed in that direction...

I am browser deficient at present and can only hunt the newsgroups for this stuff so any help would be appreciated, I will do some general searching when there and will drop a line on anything I find.

Thanks in advance.

>thanks alot
>dan in ny

There are two base station transmit groups:
869 to 894 MHz, and 1930 to 1990 MHz.
Many people refer to the 800 MHz band as "cellular", and the
1900 MHz band as "PCS". Although this is common, it is
incorrect. The 800 MHz band does support CDMA, TDMA, as well as the
standard original FM air interface. Some service providers
market PCS service on the 800 MHz band if it is digital.
The 1900 MHz band is newer, and supports
CDMA and TDMA. There is no effort for FM on this band, because
digital technology is more spectrum efficient.
These frequencies are used in North America, other countries have
slightly different band plans, and some use a different air carrier known
as GSM; which is another digital technology.

Note:
CDMA: Code Division Multiple Access (digital)
TDMA: Time Division " " (digital)
FM: Frequency Modulation (analog)
Al

Hello,

I am looking for a wide band hand held receiver, like a Yupertu MVT-7100.

To swap, I have an almost new Yaseu VX-1R dual band HT. It has wide,
75-999Mhz (minus cellular, except image) receive. I will include the
computer interface, software and a MFJ lapel mic.

The Radio Shack discones are made from aluminum clamed to steel screw plugs which is a noisy design due to the loose
clamping.
The Diamond discone consists of aluminum with no clamps, but tightened down with a hex nut into the solid steel center head.
Much better, stronger design.

2667. Re: Coke Antenna Mystery Exposed!

Newsgroup: rec.radio.scanner

Now duh. That's what the antenna is for. The temp sensor will be at a local coke headquarters where people can't jack with
the temperature sensor and then headquarters will just beam the price to all local coke machines.
That way the machines themselves can't be jacked with except the antenna torn off in protest of price jacking.

> I don't see why anyone has thought of finding the Temp. sensor

The Mambo Kid is obviously an R8500 fan and I could not agree with his statements any more. I have been doing a lot of HF monitoring lately and the R8500 is a great low band receiver. Add to that the capability to monitor
up to 2 Ghz and what can I say. It's simply a remarkable receiver.

While I don't have a BC760XLT in my shop at the moment, I do
have its brother, the PRO-2026. The light receives power from
a 5V regulator (LM7805). I thought the 760 used the same voltage
regulator (going from memory), in which case the voltage to the
light would be 5V, not 8V. IMHO, 5V would make the 12V bulb
Radio Shack sells, the one I referred to in my original message and
the one mentioned in your FAQ, much dimmer than the original.
I'd check the voltage regulator rating before selecting this as the
replacement.

Bottom line, it is EASY to access and swapout. You could always
try the 12V model even if the 760 does use a 5V reg. I just prefer
to go with something closer to stock and since I do a lot of shopping
for electronic parts online, waiting a few days wouldn't be an issue
for me. I would like to know (got me curious now!) what the regulator
that feeds the light going to the 760's light is rated at.

For Sale: AOR AR8000 *UNBLOCKED* (was purchased in Europe)
Frequency Range:
500 kHz to 1900 MHz
Receive Mode:
AM, NFM, WFM, USB, LSB, CW
Frequency Step Size:
50, 100, 200, 500 Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50, 100,
200, 250, 500 kHz or any multiple of 50Hz up to 999.995 kHz

Comes with rubber duck antenna, 4 NiCad batteries, wall adapter/charger,
cigarette lighter plug, belt clip and carrying strap.
Also with protective soft case.

In perfect condition and in original box.
PRICE: $550

Optoelectronics Model 40 Scout Frequency counter
10MHz-1.4GHz frequency range
400 frequency memory
Includes: NiCad battery,AC charger,PC software,Manual
Also incudes:
Soft case and mini DB32 antenna
*Can be used to reaction tune the AR8000

In perfect condition and in original box.
Price $250

Source record: 103208

Hello to group:

I went out and bought a new Pro-94 (dual trunking 1,000 channel) toady, so I've decided to get rid of my Pro-64. It's a 400 channel AM/FM triple conversion scanner that is programmable via a computer interface cable (which I don't have, but know it is easy to make). I also have the optional leather case for the radio, and I'll throw in the #23-288 battery pack with charging stand (never used) as well since my new radio can't use it. This radio is in absolute mint condition (I don't have the original manual, but I do have a copy I can send), as I've only owned it for about 8 months.

Price $135 plus S/H (should be around $5-10 or so) to anywhere in continental US. Thanks......

Marc

Hello all,nice group to lurk in.
Many things about this radio I like.The search and svc makes it
easy for even a dummy like me to find cool stuff to listen to.
The thing's I dont like is the fact that you cant program the
Talkgroup Ids if you are not locked onto the control channel.
And the stubborn serial port interupts on my home puter
which dont allow me to use the cable to interface.
Well I took bc245 on road velcroed to console hump with rubber
ducky inside a van on a journey one day.
I had the central troop locked and scanning
about 40 ids.Proceeded due south signals crisp and clear
ALL the way to near the Atison recreation Area
.
From there comms got staticky and within 5 miles south of Atison
They just faded out.3 miles more of flickering drops
down to the talkgroup out of id scanthe control channel
was lost.
I only recognized this at one barracks on the Garden State
Parkway.At the Bass River barracks there is a dual tower systemThe new tower is a good
15-20 ft higher than old one.
Their southerly facing dual pieplate microwave antenna has this
very odd red lightning symbol on it.
Kinda spooky like the gestapo hahaha.
I guess It also could mean do-not put face here.
Like to hear from anyone with success on stubborn ports
and bc245 with cable from this area.Or any one with some
good milcoms for the many ranges and afb's in the central nj area.
Once in a while I head out to near Ft. Monmouth that would be a goodie if
someone has any freq's.

Likely.

>
> "Stopped at a Kelly" [stoplight or stopsign?]
>

Green light.

>
> "I'm in the hot/cold track" [left/right-hand lane?]
>

Yup.

>
> There are a few others; I may post them when I get a chance to write
> them down. Am very interested in learning what these terms are, AND
> please post any known Halton/Peel/Toronto Metro 9 and 10 codes, too!

>
>

I've heard the terms fish, oil, ice and sun to describe directions too. Also, three letter street names are the last letter of the street and then the first two. ie: NMA = main street, hhi = high street etc. There is often a name associated with a street. ie: The President = kennedy road

I really don't know who the police think they're foolin' with this jargon. The fact that they are speaking in riddles just attracts more attention, if you ask me.

I'll give them credit though they are hard to spot!

It's best to turn it off when not needed. The EL panel will become dim
with use and is neither easy or cheap to replace.

This is not a modified US Pro26. It is the real thing. Model number 20-9506, date code 7A5. It covers 25 - 1300 mhz with NO gaps. All freqs within that range are covered and it scans at the rate of 50 channels per second. You can program up to 200 frequencies into the banks. I am including a $40 "Max 800" antenna (bought from Grove Electronics) designed to optimize the 800 mhz range, a second rubber ducky (along with the original) that is supposed to be the most highly rated available ($25), an AC adapter ($10), a 90 degree adapter for the antenna allowing use with the radio lying flat, and an outside antenna with mounting brackets and about 50 feet of coaxial cable with connectors on each end. This antenna would probably cost $75 to replace, with the coax and connectors. The unit is in like new condition, with box and manual. No scratches or physical defects. Works perfectly. Asking $340 and I will pay shipping, which will probably be about $20 with insurance. Email if interested. trunge@home.com

Regarding the Radio Shack discone:

The frequency response is VERY flat from about 100MHz to about 1.3GHz.
I put one on an HP network analyzer and swept it.

The elements are stainless (not aluminum), but they are hollow, and
they are crimped onto stainless-steel threaded studs. Be careful,
they break off of the studs very easily (first-hand experience).

The whip in the center is pretty useful, if you do anything at 50MHz.
It can be tuned to a pretty broad range, with an SWR less than 1.5.
I can't help but think that because this is sold primarily as a
scanner antenna, that the whip was added for those who might be
inclined to scan cordless phone frequencies.

The whip (or anything else we stuck in it's place) had ZERO effect on
the response anywhere above 100MHz)

There is a significant gap in coverage at the low end, i.e. there's a
peak at 50MHz, then a dead zone, then the discone itself comes alive
from about 100M to about 1.3G

I was skeptcal at first, but now I think it's an excellent value. In
theory, it shouldn't have the gain of the Channel Master, but then
again, the RS is totally flat. I don't think the CM is. My solution
is to put in a wide-band head-end amplifier. So far, it's working
great.

The Active X and Java won't screw up anything. I've been on the net for 4 years, and have never had anything harmful occur to me due to Java or Active X. In addition, I work for an Internet gaming company that relies heavily on Java for our games.
Don't make uninformed, sweeping generalizations about time-proven technology that has helped turn the Net into what it is today. Go get a real browser (version 4.0 or higher), stop complaining, and catch up with everyone else who upgraded long ago. If you can't handle the high speeds, stay off of the freeway, and make sure your Model T is street legal.

Hello,
I have an 8 channel PLECTRON "Auto-Scan System FM Monitor Reciever" (Scanner). Model #S-311; Serial #10809. Size is: 9.5" wide by 3.25" high by 8.50" deep. Has original factory manual, works and needs only an antenna. Codition cosmetically is a 8 or 8.5 out of 10 with a 10 being excellent.

If someone might have a "ball-park" figure on the dollar value of this one, I would appreciate it. I am going to need to sell some of my radio stuff as (we all go through this, don't we....) there is yet another HT ham unit I want and can't afford unless give up some other stuff. I had bought this one because i had heard or read somewhere that some Plectron units are quite desireable to own and use.

So, if there is anyone out there with an idea, please let me know so I can decide if this is one of the ones that will go.

Thanks a lot,
Ray Miller N2NJK

Actually, I don't think any of them are terrific but ARC5000 is the
best of the slim pickings. Shareware, for $50 it's worth the money.
Much more flexible than the others. Does what you want--load, reprogram
bandplan etc. without a lot of weirdness. The others I've tried were
buggy or had really ugly interfaces.>

Thanks for the warning - but I doubt their lawyers would have that much
luck this side of the water, they would have a *very* difficult time
proving I am posing as anything to do with Tandy corp [apart from
owning a couple of Taiwanese/Chinese radios that they re-sell as their
own kit]. they would have to trademark "Rat shack" first, surely? :)
FYI I use the screen name as like these radios, I too have ancestors in
China, and I was born in the Chinese year of the Rat...

Incidentally ISTR that the shops here are called "Tandy" as when they
first started selling stuff in Britain back in the 1970s there was
already a ham radio shop in existence called "The Radio Shack" which
took *Tandy* to court, and won!

[We too call Tandy Rat Shack, sometimes as they have started promoting
the Radio Shack brand more these days, I think the British ham store may
have gone out of business now :(]

Jeff, I have had the Hustler discone up at 35 feet since 1986 and it continues to work quite well for me. I can hear public service stations up to 40 miles away. By the way, it's time for me to change the coax (RG-8). I have two scanners running of this antenna, BC-9000XLT and Regency MX-7000 located in different rooms of my home. This antenna will also handle amateur radio 2 meters tx/rx if needed.

The mod for this scanner makes it receive those interesting frequencies in the 350-400 MHz range in NFM mode and 5 kHz step. Does it mess up the military aircraft that use frequencies in that range? Is there a different mod that removes the gaps?

Thanks,
BTJustice

Radio Shack lists the PRO-92 for $349. For my money I'll buy from Scanners Unlimited. Glenn Coen the Owner of S-U is the only person I could get a straight answer from and he always e-mailed me updated information when he said he would. Glenn obviously cares about his business and his customers. That means a lot to me so I'm buying from him. I'll have the radio at the begining of next week.

Thanks Glenn!

Granted, but both are made by Uniden and are very similar.
That's why I was curious about the voltage supplied to the
lamp.

> Lamps in the BC760XLT are powered through low
> value resistors (2.2 and 4.7 ohm) by a uPC7808H 8 VDC regulator.

That's the answer I was looking for, thank you. Based on the regulator being 8V instead of the 5V used in the 2026, your suggestion is a good one. The 12V bulb would be worth trying.

> I have measured the lamp voltage while servicing BC760XLTs.

I did the same on the 2026 (while looking for a solution for the original request). That's what got me side tracked on the voltage requirements.

Keep up the good work Bob!

I know this is slightly off topic; but my question is about Police in the Peel/Toronto region.

I was in that area at the during the Civic holiday weekend. I noticed the police in Oakville(Halton Police?) and on the subway in Toronto wore their personal (normal duty) body armor on the outside of their uniforms.
Why?

Was this some sort of way to try to keep cool or for some other reason?

I am a police officer in North Carolina, and in NC police officers wear normal duty body armor under their clothes, the only body armor that is worn over a uniform is heavy duty assault gear that used in situations where automatic weapons are deployed and likely to be used.
Again my question is: why do police in the PEEL/T.O. region wear their body armor on the outside of their clothes?

"oooohhhh -- Radio Shack wants to take over my computer!" "oooohhh-- Radio Shack is trying to put cookies all over my hard drive!" The only thing Radio Shack wants to do is sell you consumer electronics, not sabotage your computer, you paranoid freak.

And like I said before -- If you refuse to deal with Java and Active X applications, you cut yourself out of about 70% of what the net has to offer, and 99% of what it will eventually have. And BTW, I didn't hear you offer any credentials, but since you post using deja news, I assume you're just a troll who's pissed that his little tag-along rag on Radio Shack didn't go unchallenged. Not upgrading to the higher level browsers is like trying to ride a bike on a five lane highway -- it's not going to work, and you're going to get passed by. Facts are facts -- no one is out there trying to destroy your computer, at least no one at any kind of commercial site, like Radio Shacks. Obviously you shouldn't go around opening Word documents from weird places, or opening strange emails, but since Java and JavaScript both require certificates to do any kind of real work on your system, we're pretty much safe from most threats. Using judgement does help -- hiding your head in the sand doesn't. I don't know if you heard, but the more recent incarnations of Java are far safer to the consumer, but then you claim to know it all, so I'll just have to assume that either you:
A. Are a lying troll
B. Are a complete moron

Either way, I do know what "plonk" means -- you just made it into my blocked folder.

Kiss my ass.

(To all others on the NG, I apologize, and will write no more on this subject.)

I've been using ARC5000 for about 2 months. I'm very pleased
with
it - it simplifies the operation of the radio and is great for
memory
management. It's quality s/w and worth the money.

Its not just the Rat shack.

My day job is at a UK-based computer/electronics company which ships
stuff for various embedded control systems all across the world.

I once got a message to ship a bunch of *software disks* to the USA -
attached to this message was the following note:

- "Please set to 110v"...

2744. Re: Pro-94 owners?

Newsgroup: rec.radio.scanner
Date: 1999-11-05 00:00:00 UTC
From: anti.spammmwfenior@hotmail.com
Message-ID: <382221d3.1815123@news.supernews.com>
Source record: 103214
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I purchased this radio on monday night. I like the 1000 channels a lot
(even though I haven't come close to using them yet) and I like the
extended frequency ability.

But now after a few nights using the radio...
The extended frequency is not continuous to 1300Mhtz.
The programming is a little difficult for trunking.

BigBummers:
no computer interface
no cord
no batteries
no (cheapo $1.00) earphone
I dislike the confusing buttons (how do you shift and when)

So some of these things are anoyances, and others (computer interface)
are a little bigger. I discussed and debated this for a long time with
a coworker today, and considered that this unit and the 245 are close
compromises considering what you get.

Decision:
We ordered two of the 245's from Leland at Lee Electronics this
afternoon. Tomarrow the pro 94 goes back to radio-snack. That radio
should be in the $129-159 range... not $199, and certainly NOT $299!

my 2 cents...

No, no, no! Silly people! The price will not go DOWN BELOW the original price! Say fifty cents base price, and up to 75 or 85 cents when the heat goes up. If the drink is a dollar, maybe $1.25 or $1.50 possibly.

I think it's an unconscionable thing to do, but if the price is too outrageous anyway, I'll go to another machine.

But what do I care about you poor Coke slobs anyway? I drink Dr. Pepper! Bwa ha ha ha ha ha ha ha ha!

Source record: 103221

Hi Everyone!

Well, it seems that my concern that John Mackey & Bill Cheek have made this NG worthless has been addressed.

If you are just joining in, I previously stated that I purposely avoided this NG for years, mainly because of the two aforementioned jackasses. In the meantime, I found many scanner-related Internet resources that told me more than I ever could know, without the excess baggage y'all call "Cheek vs. Mackey."

I came back hoping the bullshit had passed, but it hasn't. There's a big wide world of scanning out there, and I won't live long enough to piss away my time on this lousy flamefest . I will certainly lurk this NG and respond to posts via private email, but as a public forum forget it.

If I had any advice for y'all, it would be to go "ON STRIKE" against Cheek and Mackey. Do not reply to any of their posts, no matter how much they offend you. Ignore thier every word. Sooner or later they will wither and croak from the lack of attention, and this NG will be a much better place. Yes we can do it.

Have a nice day everyone. Flame me all y'want, but there will be no public replies (I promise!). I'll check back in a year or so.

Later,
Charlie

Hi all,

I've been playing with WACARS 0.7 and have a problem that I believe may have been reported and possible solved before.

The problem is that after about 5 - 10 minutes the hard disk starts running and does not stop the program stops working and my system locks up, so all I can do is switch off and re-start.

I've look at the WACARS web page and tried the solution there, its does not work for me.

I would like to be able to use this program, and hope that there is a solution.

If there is one could some kind person let me know.

>down with a hex nut into the solid steel center head.
>Much better, stronger design.
>
I can only comment on the first diskcone that tandy offered. It is
stainless steel rods, with hex hold nuts, that screw into an aluminium
block. Mine has been up for a long time (when did they intoduce that
thing..1984 oe 5?) and while I take it down about every 5th year to
change the coax, check the connector, it has never given any trouble
with loose elements. This is the one without the vertical stinger.
Every fall I borrow a Spectrum Anaylzer from work, take a look at the
ATC (1040MHz) noise, and based on the signal strength use that to decide
when the coax need changing. Even the good stuff starts getting more
loss with time. And I figure that the first time I change out the coax,
and the ATC noise is still "Weak", I will have to change my antenna.

Thanks, I try to offer good advice and to keep my opinios clear and
seperate from the "facts". Scanning (and SWLing) are supposed to be
fun. And a lot of "Elmers"(older radio exterts) spent a lot of time
showwing me some of the "Tricks of the trade" and this is about the only
way to repay those guys. Most are silent keys and if we all hide our
bits and pieces of knowledge there may not be a next generation of radio
hobbiests!
YMMV

People that whine about it like you do, and refuse to learn to use their filters, .contribute just as much garbage to this group as the Cheek/Mackey debate does. All of YOU show a classic pattern, just like Mackey does. You show up on the group, whine about it for a couple days, and then disappear. What do I have to do ? Come over to your house and program the damned filters FOR you ? Don`t you want to learn to use your software more effectively ? You flatly state, in your message, that you have been on here for a couple of YEARS. Yet, in all that time, you have not learned anything, either about Mackey, or about your software. This says something about your ABILITY to learn ! This also says something about your willingness to be "pushed around and pushed out" by looneys like him.
Are we supposed to care that you don`t want to stick it out , and learn ? It is not my fault that you run like a dog with its tail between its legs every time Mackalooney barks.

Robert,

You are writing about the Radio Shack PRO-2026,
a different model.

Lamps in the BC760XLT are powered through low
value resistors (2.2 and 4.7 ohm) by a uPC7808H 8 VDC regulator.

I have measured the lamp voltage while servicing BC760XLTs.

In article <38225719.EB749275@globe-net.net>,
Robert <rc123@globe-net.net> wrote:

>While I don't have a BC760XLT in my shop at the moment, I do

Yes Shawn your friend is right...

I use a double conversion scanner...as triple wont get the images.

But to answer your question , I get the whole Cell band fine in the
900 MHz.

Now you can see why double conversion scanners are no longer....only
triple... :)

Hey, they are producing low paying jobs in the local community. Since
just about everything is made overseas, you can thank the free trade
politicians for that, we are basically stuck with what we get from
them. Not much incentive for the employees to become great at
something if they are never gonna make decent money at it. All the
manufactures move overseas to where they can pay a worker 25 cent and
hour and then sell the product over here, without tarriffs, for 500%
profit!

Actually you are incorrect. According to the FCC, (the people that created the 1900 PCS band), the 1900 Mhz band is called the PCS band. Companies mistakingly calling services on the 800 Mhz band PCS does not make them correct. They are simply wrong.

Message-ID: <38248173.538088D8@globe-net.net>
Source record: 103003

Before sending it off to a shop, check one thing first... This model was plagued with a batch of bad antennas. The center conductor in the BNC plug on the antenna would break, causing a sudden loss of signal strength, as you mentioned. If you have another antenna handy, swap it out and see if that fixes the problem. If you don't, remove the antenna and see if the center pin of the antenna is loose (wiggle with a finger nail). If the antenna is bad, contact Uniden for a free replacement. They may require a picture of the broken antenna pin or may want you to send them the antenna before they will send you a replacement.

Eric:

I don't know who the original seller was on the BC245-XLT, but to be fair, keep in mind, it also is a brand new model, and it can scan multiple trunked systems at the same time, the Radio Shack PRO-94 can not. This is important to some people. As for the PRO-92, yes, it sounds great, and at $350.00 it better be! And speaking of the Radio Shack PRO-94, who do you think makes it? Uniden, not Radio Shack. Not comparing apples for apples.

Bill Crocker

Ever try to obtain a cash refund from Glenn?? Store Credit only issued. Sorry I'd rather deal with Grove or another store that has refund policy's geared to the customer's needs NOT the business owner's. In all fairness to Glenn, he isn't the only scanner store that has this policy, so my advise is to ask what the refund policy is BEFORE buying anything.

2787. PRO 94 $189 Sunday only at RS

I have a Bearcat 210 10 channel scanner that is about 20 years old. I need a replacement battery for the memory. It origionally had a small watch battery, Mallory 10L123. No one has a reference to that battery anymore. Does anyone have a BC210, and what is the current battery replacement for it? Thanks in advance.

After last nights attempts at tracking Motorola 2 system, the Pro-92 is acting like a new radio today. Am not sure why, the dispatchers mentioned a couple times that THEY were having problems with the radios yesterday and the Pro-92 was more sensitive to that. For more deatils see updates at Strongsignals.net trunking board.

My biggest complaint about Rat Shack is they have a lot of things, but carry next to nothing in the stores. Most of the time you have to order it and wait to get it in the mail. They didn't have a power supply, AC to DC 9 volts @ 1 amp, so I had to go some where else and THAT place not only carried it but had it in the store.

2824. Bus company frequencies in Bristol

Newsgroup: rec.radio.scanner
Date: 1999-11-06 00:00:00 UTC
From: In2Home User <user@leezes.in2home.co.uk>
Message-ID: <941853295.9002.0.pink.d4e11390@news.in2home.co.uk>
Source record: 103053

Does anybody know the frequency (ies) for the bus company in
Bristol ?
Does anybody know any other good frequencies in Bristol?

2825. FS: DTMF (touch tone) decoder display board

Newsgroup: rec.radio.scanner
Date: 1999-11-06 00:00:00 UTC

Source record: 103054

Hello, I have for sale a DTMF Display Decoder Board made by Motron
Electronics. It hooks up to a scanner or other audio source and will
read out touch tones heard.
Go to http://www.motron.com/products/122.info.html for more info.
I will ship for $65. Thanks, Mike
mfunaro@worldnet.att.net

Has anyone called Grove? It could well be a typo, since the other
Radio Shack scanner prices were all "list" price...

Ray:
The value of the 8 channel crystal scanner will be $10 to $20. If the scanner was very clean, and an 8 is borderline, then a collector may pay up to $40 for the same scanner. I have been buying and selling scanners for 30 years, and have many of my old xtal scanners.
Hope this helps, Doug.

For anyone in the area and anyone interested, I started a group for the South Brunswick Twp. NJ EDACS system for the exchnage of information and ideas. There is a list of TG's for the system in the files area. Anyone interested to signup and I'll turn it on for you. It's at SouthBrunswickTrunk@onelist.com.

Also- still looking for a good way -other than guessing- to determine the base frequency and offset for a 500 MHz system used by East Brunswick NJ- Moto II. Any suggestions?

It is that all over Canada....

>Was this some sort of way to try to keep cool or for some other reason?

Cool in Canada...heh, I am unsure why...it seems that that has been
the way they were em for some time....even back in early 70's.

>I am a police officer in North Carolina, and in NC police officers wear

>armor on the outside of their clothes?

While we are not ammune to automatic weapons here , we dont have the
probs the USA does, we have gun laws...and those weapons are not
common place..no offence to my USA bro's in uniform..

However with gun control laws...etc...there is no need for heavy body
armour vests , only on SWAT...or ERT teams where the risk of personal
injury is high.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Many Canadian PD's adopt this practice. I wonder if it isn't a little more hygenic in the hot summer months... it allows a bit of cloth between the armour & the wearer's skin... ?

You could ask 'em yourself - here are their sites:

Toronto Police:
http://www.mtps.on.ca/

Peel Regional Police (Mississauga, Brampton)
http://www.peelpolice.on.ca/

Halton Regional Police (Oakville, Burlington, Milton)
http://www.worldchat.com/hrp/

If you're in the area again and bring your scanner, then go to:

www.ontscan.com

It's an excellent Ontario-wide source for local Emergency Service frequencies & trunk radio talkgroups (Toronto & Peel are Type II, & Halton Region is EDACS).

There is also interesting info on the Peel Region trunked 800 Mhz Type II police/fire system, including info on their portables at:

http://members.home.com/ian-bain/peelemrg.htm

This doesn't pertain to your question, but I HAD to add at least SOME info on scanning back to this posting :)]

2839. FS Pro2032 $100US

Newsgroup: rec.radio.scanner
Date: 1999-11-06 00:00:00 UTC
From: gary-jacek@home.com
Message-ID: <Z_OU3.5396$I82.126018@news1.gvcl1.bc.home.com>
Source record: 103068
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.equipment

The following unit is surplus to my needs and is looking for a good home.

Pro2032 200 Channel Scanner (Base/Mobile Unit) with original
box, antenna and manual.
Date Code 3A4 (March 1994)

This unit has been operated in a smoke-free environment. I rate it 9/10 cosmetically
(dust),
and 10/10 functionally. The EL display is very bright. It has never been operated mobile.

Modified as follows:

1. Discriminator Tap -- can be used for digital signal decoding with programs like TRUNKER,
RADIO RAFT, etc.
2. Crystal Speedup -- slightly faster search and scan function.
3. Full 800MHz -- as shown at http://members.home.net/gary-jacek/Pro-2032c.html

Click on "Pro-2032 Specifications" to view the factory specifications for this unit.

I have done a DejaNews search and $100US looks like the lowest price you will find
a used Pro2032 going for. So my price is $100US plus shipping. No low-ball offers please.

Payment in advance by Postal Money Order in $US or $CDN equivalent.

If you are like me and use Deja News to research a vendor before dropping money in
the mail, please go ahead and search for me using the Keywords "Gary_Jacek*" and
"gary-jacek*"
at http://www.exit109.com/~jeremy/news/deja.html . I recently changed ISPs so
this will get you a far better "history" of me.

You might also want to bookmark that site as Jeremy's user interface into Dejanews
beats the heck out of the advertisement-laden "official" Dejanews search page.

Please respond by email to gary-jacek@home.com

I see many people looking for these wonderful scanners. I own one and it is PERFECT. No scratches or anything along those lines. It even wasn't modified when I got it which was damn rare. You do need to be careful though when buying one.

I recently discovered something I think any buyer or owner should know. The last of the 2006's have a button next to the Sound Squelch button called LIGHT. These are 1994 models which are much newer of course than the early 90's models which have a DIMMER button instead of a LIGHT button.

A seller who has the original box, manual, antenna, etc. that came with the scanner usually is a person who cares about what he owns and therefore takes care of it. I like to deal with these people instead of people who only have the scanner and possibly the manual.

If buying one, the newsgroups are OK sources, but eBay is better and I will tell you why. When you have an auction at eBay, it is a very legal auction. E-mails are considered to be legal documents in the eye of the law. Before making a bid, be sure to get the seller's name and info. Learn everything you can about the seller. Call 411 and double check the phone number to be sure the seller is truthful. Call their Internet Service Provider and get their name by giving their e-mail address. Always pay with either a Cashier's Check or a Money Order as you will have better chances of getting a refund if screwed by the seller.

Hopefully Helpful,
BTJustice

My biggest complaint is when other stores don't have products because
they think Radio Shack carries it. Too often these chain stores (corp.
owned or franchised) reduce consumer choice, lead to inferior products
as other stores reduce prices to compete, promote lower work wages, take
money out of the community, and are generally of little benefit to the community.

Message-ID: <19991106082612.01880.00001423@ng-ci1.aol.com>
Source record: 103079

Could anybody point me to a site that has freeware or shareware software to program channels and functions for an Icom R10. I see lots of companies that have the controlling software, but all I want to do at this point is just program and alphatag the channels. I have the cable which came with my R2 (R10 uses same) and Ive ordered the Icom software, but would like to program while I await the Icom package. I have programmed two banks already but it would really help to speed things up with some programming software.

Thanks

Monty

2851. BC-100XLT questions

Source record: 103080
Cross-posted to: alt.radio.scanner,rec.radio.scanner

First of all, I'm looking for an instruction manual and/or a service manual for the Uniden BC-100XLT scanner.

Aside from that, does anybody know how to set the priority channel on this thing? Uniden's "Customer Service" told me that pressing PRIORITY while on the frequency that I wanted set would do the trick. Not.

Also, on my dad's BC-60XLT, the manual says that you can turn all locked out channels back on by pressing L/O for 2 seconds. This doesn't seem to work on mine, though. Is there any way to do that on the BC-100XLT?

Finally, is there anyway to store one or more search ranges?

Thanks for all of your time and anticipated help...

Actually, go to www.coacolacompany.com and look for their statement on vending machine technology. They deny that they're doing this, and I tend
to believe them. If they do this, Pepsi wont and they'll lose sales to Pepsi, which is a mortal sin to them.

I don't know how Reuters got ahold of this, but from the get go it smacked of urban legend to me, next the machine will detect the race of the
purchaser and sell for lower prices to whites. (That's a joke son....)

While I deplore the the language and uncalled for obscenities
of the two posters in their reply, unfortunately they happen to
be correct in the assessment of the formidable problems brought
by the advent of ActiveX controls and Java. These two
advancements can be highly destructive. They can infiltrate
any system if it is not protected decisively by specific
software to combat them.

2865. Review and comparison Pro-94 and BC245xlt

Newsgroup: rec.radio.scanner
Date: 1999-11-07 00:00:00 UTC
From: anti.spammmwfenior@hotmail.com
Message-ID: <3825d65e.2831524@news.supernews.com>
Source record: 102894

Several messages in the group here asked for comparisons... so here is my unsoliced 2 cents worth...

I have both radios, (one sitting on either side of me right now). I'm a little new to the "sport" but I'm one of the "never satisfied guys" so weigh my comments accordingly.

I purchased the pro-94 as my second scanner in one week this past monday (the first was the SC-150 which I promptly returned to walmart). I didn't like the 100 channels on the sc150 and I didn't like the lack of features. I knew that I was going to want a lot more channels and wider frequency response. I thought I was getting that for about the same price with the pro 94 at $199, with the addition of trunking (which isn't being used locally yet, but I know will be important soon).

Well, being the disatisfied type had me surfing the web pages in a couple of days because I was again disappointed. The gigahertz frequency range was very short and unusable. And then after reading the impressive reviews on the Strong Signals website convinced me to by the 245 from Lee Select, (and he has a great deal going right now btw for $199.00).

So I got the new 245 yesterday and did my programing of the scanner via computer and modem to uniden. A HUGE disappointment is the 900 number to do so, but its only a dollar a minute and I waste way more money more fivolously than this... so what the heck.

A huge determining factor in purchasing this scanner is is its ability to connect to computer and software. I'm not real impressed with any of the shareware programs, but haven't had time to really delve in yet.

I HATE the response of the 245 compared to the pro 94. The 245 is skipping in and out of calls while the pro 94 seems to hold most calls better, and this is with the same settings on both radios I'm pretty sure.

The squelch on the pro94 seems superior. It cuts of the scratch almost immediately at the end of a call, where the duration of hte scratch noise seems to last about 4 times longer (a second or so).

So for my money now, I'm not real sure. The receiving ability of the pro 94 does seem a whole lot better, and I like the 1000 channels and extended frequency range (see bottom of post). Cosmetics wise, I like the sleekness of the pro, but I also like the bigger buttons on the 245. The 245 has easier to read numbers (especially when you set the

display lght to come on) than the pro 94's tiny numbers. One of these radios must go back to the store, and I'm afraid I'm leaning toward sending back the 245.

Some other stuff is influencing my opinion the other way is that the pro-94 scanner immediately needed an additional $30 purchase of rechargeables... I found that annoying. Add to that, it needs a a power cord too. That will be $199 for the scanner + $50. Radio Shack needs to do better... they don't even include the cheapo one-dollar earpone like the Uniden. I has a more complete package.

After some additional surfing the best software without doubt is the freeware created by senss at:
http://www.iquebec.com/senss/

This software compared to the other shareware stuff out there couldn't have been any more plug and play... Here's a good interesting thought. Uniden should pay this guy for the software and for a year or two continued development and include it free with the scanner. The software is excellent.

Trunking performace was signficanly different between the two radios. I took a drive to Saginaw and sat in the park for a while and watched the two scanners that were programed the same. I thought the Pro again outperformed the 245. The display was quite a bit better, and again the 245 missed a lot of calls.

So here's the difference in frequecies received by the two scanners:
245xlt: 29-54 108-174 406-512 806-956
Pro-94: 29-54 108-174 216-225 380-512 806-960 1240-1300 MHz

So for you real guru's on the group, do you guys see any of this as a big issue? Or am I "anal"izing too much? In my opiion, its unfortunate that Uniden put a little more into the Radio Shack model than their new flagship.

Hey!

While mobiling around, and working those rare DX stations, I have found it rather frustrating to scramble for paper and pen. I don't have an easy way to install a laptop in the car, either.

So, I thought, "I can use my Palm Pilot" and create a memo. But that was a bit of a pain. What to do?

Create a log program! That's what I did. It is now version 0.1 -- and works ok.

You have a Palm Pilot? Wanna use this logger? Come download the free Application at:

http://hfradio.org/softdown.html#hflog

I have been using it during my jaunts. Helps. It is very simple, and very basic.

Send comments to: hflog AT hfradio DOT org (you can figure out the address)

In other news: The NW ARRL (Northwest Section of the ARRL) website is now hosted at http://hfradio.org/nwarrl/ - and I have been appointed as new Webmaster. If you are in the NW, and have updates, etc., please let me know. If you are interested in the NW Activity, etc., come check it out.

Also, I am still offering free websites for HAM and SWL sites. Want to make your own page? Come and fill out the form.

Don't forget: http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you

are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

Anyone know where I can get one of these scanners in the states. I know they are for fcc approved sites only. Would like to get though. Thought maybe have to go to canada and sneak it back in the states. Also, how much are these? Anyone have any experience on this scanner and if so, how good is it?

There will be 'penny pichers' out there who will buy an outdated product (eventhough there is a new product out for not much more money). I am referring to the BC245 of course. I am still going to wait for the PRO-92 to go on sale (won't be as far as the Tandy people are leading us to believe). When my new PRO-92 gets outdated, mayybe I will get lucky and find a 'penny picher' to buy it from me so I can upgrade.

Hello All,

I need a Bearcat BC-55XLT for the parts.
I am in the need of all the tuning coils and caps.
I just bought one, and the idiot that I bought it from I guess thought that he can modify it simply by adjusting all of the tuning coils and caps!!! What a dud! :)

Anyways, if you have one to sell, give away, or trade, please let me know. I may also be interested in the Service and Operating manual for this. I do know, however, that this scanner is not of high value, since it is about 15 yrs old and is 10 channels.

Please E-mail me or call me.

E-mail: radiotek@pacbell.net

Phone: (661) 272-6949

Thank You & 73,

There is a significant number of people, myself included, on this group who have complained about the response times of one or two websites, yours being the prime one. Why must you fight us? If its slow it's slow! You have several options

1) ignore the criticisms and have less people visit your site
2) criticise the criticisms, refuse to address them, and have many less people visit your site
OR
3) Treat the criticisms as being generally constructive, do something about it, and have more people visit your site.

Your choice.

I.D.

Here is my mobile antenna, it works:

I have cut a s/s 108" whip to about 48" to use as a scanner antenna. If
you apply the formula "468/ freq = length of antenna" you will find that
a whip that is from 48" to 54" is harmonic on low band, VHF, UHF and
will also work for 800 mhz.

rec.radio.swap,rec.radio.scanner,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.amateur.misc

Hello,

I originally purchased the equipment below for an amateur radio project, but I lost interest in pursuing the project. If anyone else would like to try their hand, or whatever, please be my guest. Phones are in good working condition far as I can tell. Would like to sell everything as a package. Serious offers considered.
TERMS: Prepayment by postal money order, prices include UPS ground shipping or USPS Insured where applicable. I will also consider trades for Motorola Star-Tac accessories such as a Motorola Star-Tac Desktop Charger(s), high capacity Lithium-Ion batteries (black), etc.

(1) Motorola "Flip Fone" Gold Series, dark gray, in excellent condition with leather case, tabletop phone/spare battery charger, Standard NiMh and slim batteries ..... $ 40.00

(1) DiamondTel Mesa 90X, in very good condition, with tabletop phone/spare battery charger, two standard NiMh batteries, car adapter, and instruction manual ..... $ 40.00

(1) Motorola "Flip Fone", lt. gray. This phone is in good condition with standard battery and tabletop phone/spare battery charger ..... $ 25.00

The DiamondTel Mesa 90X and the Lt. Gray Motorola Flip Fone were purchased at a local Amateur Radio show from an individual who I believe was a tinkerer. It wouldn't surprise me if the two were cloned, but I have never actually used the phones. I purchased them for a Amateur Radio microwave project but never actually used them for the project.

I also have the following accessories:

(2) used antennas, one "back of the set" antenna and a "window" portable, both rubber ducks ..... $ 5.00

(1) used battery eliminator for the DiamondTel 90X ..... $ 5.00

(1) Brand New in the package battery eliminator for the DiamondTel Mesa 90X ..... $ 10.00

(1) Brand New in the package 6V NiMh Lt. Gray battery for Motorola "Flip Fones", Micro-Tac, etc. ..... $ 10.00

(5) Brand New in the package 6V NiMh Black batteries for Motorola "Flip Fones", Micro-Tac, Flare, Elite, etc. .....(EACH)$ 10.00

(3) Brand New in the package NiMh batteries for DiamondTel (EACH)$ 10.00

If interested, please e-mail directly n3fvg@worldlynx.net Thank You

What did you use to cut it? I've tried cutting four or five whips in
my life (or antenna elements to trim the frequency) and it always
seems to be quite a chore. IIRC, I usually end up scoring around the
outside of the element then bending it off.

There must be a simple way!

If you want to see if they sell your name/address, just tag your name with a different spelling or variation of your name: Richard - Dick, etc. Keep a note of who you gave which to (so you can be consistent with each company), then if junk mail comes in, check the list to see who sold it.

Or did you mean BIZARRE black helicopter class rumours?

Ron of that ilk.

Two days left for this highly rated base station scanner antenna. Comes with 50 feet of RG6 low loss cable with Motorolla connector for antenna and BNC connector for your scanner. Current bid is only $20.50. This antenna has sold for $40 recently on Ebay and that did not even come with the cable.

See http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=192113919
Good luck.

Poorly-designed frames...blinking text...long-loading graphics...Java apps...

I'm using a cable modem and a very modern desktop system. The site is a slow loader - but that's not the main problem. It's overall an obnoxious presentation.

Frames are not necessary in the slightest - more visitors can successfully read html tables, and tables would be a more efficient way to go.

More Web site developers need to actually log on to their sites to see the delays and obnoxiousness of some of their "features."

Over 200,000 in appx three months, no worry there !, and if it is not visited by people like yourself all the better.

>2) criticise the criticisms, refuse to address them, and have many less
>people visit your site

when they are made by idiots like you in the manner you usually make them it is hardly surprising.

Treat the criticisms as being generally constructive, do something about it, and have more people visit your site.

when made by somebody who has some standing in this hobby and knows what they are talking about that may be the case , I will and DO always address a problem, but as with you and the few others you contribute nothing to the group or the hobby except criticism and stupid comments based on your lack of knowledge about the subject and also make no contribution whatsoever other than the silly comments.

So instead of all the posturing, gesturing and moaning about other peoples sites (who by the way at least make the effort), why don't you go and do one and we can all scrutinise the crap out of you, but make sure you are the best there is at html and scanning or you are going to look like a complete idiot ☺!.

I am new to the hobby but I am not new to web. Even from a lay person's
point of view, I have a fair idea what makes a good site and what does not.
Your site has way too much crap and not enough core information. Fact. Take
out the crap and there might be 3 or 4 pages of useful information. So you
worked hard and had fun putting it together - doesn't mean it's perfect.
Listen to what people are telling you.

> So instead of all the posturing, gesturing and moaning about other peoples

I may put up a web site at some stage, or I may not. If I do I shall invite and welcome criticism and try to evolve it into a place of real use to people, rather than an expression of my vanity.

I.D.

What really annoys me is when someone tries to put about 8 frames on a page! One of them doesn't scroll at all, another scrolls about half a line, and yet another is about half a line in height and you have to scroll forever to read just a few lines of text. MSN's page is way too complicated and runs you in circles. I want to hit a page, find the info I need and get out. Or if it's an interesting page, I want to explore it without a lot of complexity.

Anyone remember bulletin boards? There was one brand that gave bizarre names to functions. Instead of (D)ownload file, it would have something like (E)at hamburger and fries. Totally unbearable, especially if you were calling long distance at 300 or (gasp!) 1200 on your modem.

There are a bazillion pages out there. Those who own them should make them attractive, easy to navigate and easy to read. For Pete's sake, go easy on the green text on a yellow background!

Well, I enjoyed your comments. I am interested in the PRO, but only in its use in trunking - specifially edacs trunking.

I bought the 245 the first week it came out. Use it every day, but again only on a edacs trunked system. It looks like the PRO may be a better radio would be interesting how it handles the edacs and moto systems.

I hope we can get more comments about comparing the two.

cheers

p.s.

I agree with you 150% on scanss -- it is much better than the two 'for sale' competitors out there, even in its infintile form. It would be perfect if Uniden supported it like you mention.

We are going to receive our Pro 92 on the November 15th at
http://www.scanner-outlet.com

2915. Correctoin on web address for frequencies galore

Newsgroup: rec.radio.scanner
Date: 1999-11-07 00:00:00 UTC
From: Robert Singleton <thing@freeuk.com>
Message-ID: <g4mV3.10527$bp3.465821@nnrp3.clara.net>
Source record: 102944
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner

sorry about the tyypo on the first mailing, that's what happems when you try
to post at 1 am in the morning i suppose
the correct address for the Frequencies Galore web page is
www.arriveat.com/frequenciesgalore

the web page has just been updated to the third addition.

I also run a e.mail updates service this tells you when the web page is
updated and the inbetween updates are sent directrly to your e-mail box.
also there are some file that are sent to the people on the updates list
that never go onto the web page, Like at present I am working on both a UK
and International allocations list, these lists are available to those who
are on the e-mail updates and request them. I all so run a frequency
requester service if you tel me your location I will find the relevent
frequencies of my list for your area not only now but if anymore frequencies
are recieved in the future, all to above services are free.

I am also requesting frequencies of anyone who is kind enough to send them
and I will send back what I have for your area (soory UK only at present)

my e-mail is frequencys@freeuk.com or thing@freeuk.com

so why not join us

bye for now

Margret ;-)

>
>I am one or more of those "200,000" I but I didn't stay long - hit counts
>prove nothing.

oh ok, whatever you say. well perhaps it was the many many mails i got
asking me not to close the site down a while back or [perhaps the amount of
people who thank me for hosting software that is hard for them to do
themselves ?.

>

>
>Your attitude is arrogant in the extreme.

No, my attitude towards YOU is arrogant because i treat people how i find
them.
>

>I am new to the hobby but I am not new to web. Even from a lay person's
>point of view, I have a fair idea what makes a good site and what does not.
>Your site has way too much crap and not enough core information. Fact. Take
>out the crap and there might be 3 or 4 pages of useful information. So you
>worked hard and had fun putting it together - doesn't mean it's perfect.
>Listen to what people are telling you.

you are new to the hobby yet you seem to think you know everything about
scanning therefore coming to the conclusion that all the 78 pages of
information on my site is crap?. now who's fuc**ng arrogant !.

You say you know about the web then where is your website ?, i am sure all
in here would love to see the best made site in the world according to Ian
Dempsey !
or perhaps the 8 or 9 posts to the scanner groupas makes you a bloody world
cyber traveller?.

I have never said that it was perfect, the site is there for the
information and downloads not to please a prat like you with sculptured and
woven html code.

>I may put up a web site at some stage, or I may not. If I do I shall invite
>and welcome criticism and try to evolve it into a place of real use to
>people, rather than an expression of my vanity.

i doubt if an ass like you could give anything worth a toss to the group as
you are too busy criticising others to be of any use, but please feel free
to do so I would LOVE to see what you can do and if it is good then great

!, i would welcome it for the sake of this hobby , otherwise shut up stop talking and go to a more lame group and annoy them.

eavsdropper>

i just love people that are so brave they have to hide behind bull e-mail addresses !.

2923. Re: Review and comparison Pro-94 and BC245xlt

Newsgroup: rec.radio.scanner
Date: 1999-11-07 00:00:00 UTC
From: Jeff Goldman <75162.2371@CompuServe.COM>
Message-ID: <804vkjbof1@ssauraac-i-1.production.compuserve.com>
Source record: 102952

Wayne is wrong about Pro-94 coverage at 960MHz and 380MHz. It goes to 956MHz and then jumps to 1240MHz. Likewise, just before 406MHz, it jumps to 224.995MHz.

Jeff

2924. Advice on Antenna

Newsgroup: rec.radio.scanner
Date: 1999-11-07 00:00:00 UTC
From: Bob D <bob1414@nac.net>
Message-ID: <8PoV3.508$bh7.47126@nntp1>
Source record: 102953

I am putting a external scanner antenna on top of a mobil home roof. I have tried using an L-bracket and screwing into non-visible piece of aluminum.

I get 50/50 results using an RS-2026 scanner with a 3db high gain high band antenna (Larsen or Maxrad) with a pre-amplifier hooked up to it. I get rather poor reception even with the pre-amp. I also get a background shushing noise.

What I would like to know if there is a rather inexpensive external scanner antenna that I don't have to mount to a piece of aluminum?? or something that I can dig a hole in the ground and put a pole with an antenna on top.

ANY HELP WOULD BE GREATLY APPRECIATED!!!!!!!!!!!!!!!!!!!

Bob D

How much and what kind of coax feedline are you using? Also, what frequencies are you trying to scan???

As a general rule, you don't want to use more than 20' of RG58 (small mobile stuff), because of the losses. You may want to consider RG8, or Belden 9913. The higher the frequencies you are dealing with, the more loss per foot of feedline you will experience.

Andy

2926. New San Francisco Trunked radio system

you guys have a lot of nerve, to pick on this gentleman. Although I've never met this person, being a registered monitor station, was very popular back in the '60s and '70s, it was sponsored by the same people who publish CQ for S 9 magazine, not sure which one. Many hams, started listening to short-wave, public service frequencies, before it developed into a interest in amateur radio.
Not everybody who enjoys listening to short-wave or public safety wants to be a ham. Just like some hams don't listen to short-wave broadcasters for public service agencies.
I doubt, that there's any harm in being or continuing to use the registration call signs issued by the magazine. What you care as long as he's not broadcasting on amateur radio frequencies for public service frequencies. this is America, if this is how this person enjoys his pursuit of happiness, let him, without insulting for making fun because his hobby is not your hobby.if you need someone to pick on in the radio hobby, go to 80 meters at night and listened to some of the so-called professional radio operators going at it. Let the man in joy his hobby.
enjoying your operations center , forget the ones who make fun of something they do not understand.
Steve

All the time, It is one SUPER Unit! Small, Sensitive, Great Audio, Batteries last forever, Nothing but praise from this pleased user. Had it since 2 weeks after they hit the market. I even clip it to the adjustable band on my ball cap when I walk the dog through the neighborhood, used with headphones and a little ingenuity, you can hear all sorts of stuff going on! I take it to work daily and use it in the work truck and the office as well. You won't find a better tiny unit anywhere. Of course I stick to the AR2800, PRO-2004, and BC895XLT for my home desktop work, and when the wife bugs me about listening to stuff during the day I give here the Sportcat, simple for her to use and does the neighborhood job fine from the living room. Take care. Wayne.

Ya know George,.....even if you were to get a death sentence for a capitol crime; did'ja know that states can't execute you unless you're healthy?

No sh*t, the've got to render medical treatment before proceeding with an execution. Don't that beat all? Plenty of cases where the state had to render medical treatment for heart conditions, cancers, and the like before they were able to proceed to an execution.

Aw heck.....what would someone have to lose? Right?

Hypothetically speaking.....of course.

2931. Need MOD help with PRO-2004

Source record: 102960

I have a PRO-2004 that seems to be going through 9V batteries faster than it should be. When the battery gets low, this annoying beep and low battery indicator flashes. I don't even care about holding the memory because it's plugged into an UPS anyway. Is there any way to disable this low battery circuit? If anything, I would be happy just to get rid of the annoying beep. Please help with any suggestions.

Thanks in advance,

Joe Gaffney

Yep, in Washington we won't hang a loser because he weighs too much and it was ruled by the court to be cruel and inhumane if he were decapitated when hung. Sheesh!

If I were facing what Bill is the last thing on my mind would be old grudges. Bill's upcoming battle with his illness must certainly makes everything else insignificant. Though he seemed to enjoy doing battle with the retarded one I doubt the creep even crosses his mind now.

It's a nice thought and all in this tiny usenet world but reality isn't the same. Wow, if retard could figure that out now. Never.

Just curious, why do you think Scanss is better than say WinScan? I've
tried them both and find the Scanss nearly unusable, but WinScan works
pretty well.

2934. Re: Pro-94 owners?

After having my Pro94 for about a week now, I have to say I am happy with mine. I found the price comparable with that of the 245xlt since some of the features on the 245 are not very entertaining. The 5 second delay after each transmission on a trunked system does not allow you to effectively scan more than one system. The computer control is nice I suppose if you are into that, however it surely wouldn't be an incentive for me to run out and buy the radio. I found the radio very easy to program once I read the manual. The fact that the Pro94 does not come with a battery pack is a bit of a blessing. The Nicad battery packs in the newer scanners might last for 6 hrs and then you are done. I can run my Pro94 for 24-36 hours on standard alkaline AA cells. If they go bad all I have to do is run into any connivance store and buy a new pack of 4. You can also charge Nicad & NiMih cells in the scanner so you can take an advantage of both options.

That's your right. I just wish that the Pro-91 worked as well as the Pro-90 (which was a BC-235XLT). I tried a Pro-91 when it first came out, but they cheapened the front-end.

This is a good use for an old antenna. One thing to look out for though:
Some of these antennas in addition to a coil, have a small capacitor in the
base between the center conductor and ground. At 27 MHz it resonates with
the coil to make everything work out fine. Remove the coil though and you
have an RF short to ground which will make your receiver seem deaf.

I found this out the hard way. I would guess some antennas have the
capacitor integral to the coil, and some have it separate, near or in the
base. The solution of course is to just clip the capacitor.

Ipex <ipex@aol.com> wrote:

>I'm thinking of buying one for my car.Any opinions out there?
>Larry

Larry,

I tested a PRO-2066 and published a quantitative
review in February 1999 Monitoring Times magazine.

Here are some of my comments on PRO-2066, s/n 85011645:

[...]

Usability and Performance
"Our PRO-2066 has little or no image problem and only 13
birdies strong enough to break squelch during a search,
all occurring above 406 MHz. It does suffer from pager intermod
on several 157 MHz marine channels and occasional intermod in
the 462 MHz range."
"We torture mobile and portable scanners by parking 1/4
mile away from a combined cellular phone and PCS (personal
communications system) transmitter site. Under these line of
sight conditions, our PRO-2066 hears lots of cellular signals
in the VHF-low band, some in the air band, and just a few in the
800 MHz range. Once we leave the cell site, the problems
disappear and mobile reception shines over the RELM MS200
and Uniden BC760XLT."
"There are no noise bursts at the end of trunking
transmissions, however there is a noise burst of moderate
duration while the squelch closes after each conventional transmission.
The PRO-2066 audio is substantial when used with an external
Motorola speaker inside our pickup truck."

Bottom Line
"The PRO-2066 is a good mobile scanner, especially
for people who live in areas served by trunked systems.
It provides cleaner reception than its predecessors,
though we wish it contained a CTCSS decoder and lighted controls.
The requirements for a well filtered AC power supply,
lack of rubber feet, and a bottom mounted speaker make our
PRO-2066 less suitable for base use."

NOTE: Reprints of articles from Monitoring Times are available
for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, P.O. Box 98, Brasstown,

You know what really sucks? That stupid little box that pops up "A word from our sponsor".
The price we have to pay for people too cheap to pay for a real internet account.

Frames suck.

Remember, you asked us to be the judge!

Dan

There was an interesting article in this months Nuts and Volts about the Rat Shack. Basically, when they first started selling Ham / Scanner stuff back in the 70's all the mom and pop stores cried "foul", fearing they'd be run out of business.

Instead, they've actually seen an increase in business. Apparently, the Shack carries just enough stuff to get you hooked, but not enough to keep you going. For example, the intro to Ham Radio books, the police call guides, a few basic antennas, etc. However, to get anything really advanced or specialized, you have to order it or go to another store, like you did. These smaller stores have seen an increase in business thanks to this stocking policy.

Out of curiosity, has this been the case in your area? Sadly, right now we only have one store here in Birmingham that carries a good supply of Ham / Scanner stuff, and he is getting out of it due to internet competition. Rat Shack is the only other alternative.

Robert

Amen!

I would also point out that the lack of an amateur license implies neither stupidity nor laziness but rather is the sort of elitist attitude that violates the best traditions of amateur radio, not to mention common manners.

Maybe you got a bad one. Ii am happy with
the audio from this radio. Hey, it aint
a Bose Acoustic Wave, but it is good.

The 94 is in the area of 2x the price.

As I see it
Disadvantages of 92 over 94
1) cost
2) less memories
3) slower scan rate
4) smaller freq range coverage
5) heavier, more batteries

Advantages
1) PC interface
2) Alphanumerics

Neither seem to justify the big price diff., although 1) is
nice for "backup" reasons.

The only way to have continuos 25-1300Mhz coverage is physically swap
the CPU for a European CPU.

Radio Shack / Tandy jealously guards that data base. They do
all kinds of studies on it, looking for trends. They do mailings and
analzye the results.

They came up with things like the most likely customer is someone
who was recently in the store. Sounds obvious, right? But then
they came up with battery cards and such, to KEEP you coming
in the store on a regular basis.

Hey, get ON the list! They don't mail that much junk, and just over the
last year I've gotten 3 certificates good for 10% off my entire sales
ticket (regardless of already on-sale or discounted status) and a
$5 off normal coupon I still have sitting on the counter. Over the last
two years I used one of the 10% coupons when I bought my cell
phone (with an aditional $20 coupon) and one for my HTX-242.

When they used to give out the flashlights, I ended up with 5 of them
with free coupons. Went broke buying batteries for the kids.

They do NOT give out that list!! They do NOT sell it. They guard it
like the family jewels...

Mike

Well, I tried WinScan and was frustrated with it over a few things.
I never saw the alpha tags work reliably.
The whole program seemed to be a large graphic of the handheld and mimiced the radio. I didn't see the point of using the computer to do exactly what the radio does. I was also frustrated by the multiple releases of version 1.00 -- they didn't seem to understand what version numbers were for. there were 3 or 4 ver 1.00 releases -- all supposedly alpha tag fixes and I got lost with which one I was trying.

scanss is certainly in it's infant stage and hopefully it will evolve.

some of the things I like about it is the simultaneous frequency and AFS display -- it's neat to see the freq shift around with the talk groups.

I like the GUI / user interface much better. The graphic of the BC245 on winscan hurts the eye -- too much graphics with no information.
The scanss is layed out in an easy to read easy to control way.

Like all software - everyone will like something different. Wouldn't say anything negative about winscan or radioscan, etc. but I will say that I would look forward to scanss maturing.

For now, I tried the rest as shareware and am very glad that they had a shareware version to try. I have deleted both shareware versions and now use scanss. May not be fancy, but it does what I want.

cheers

P.S. Was playing around with scanss after sending you a reply. A couple other cool things I like is the command/control screen that shows radio <-> computer traffic. Also neat is the little window that allows you to manual send a command to the radio.

The scan upper/lower limit windows make it soooooo easy to quickly do a range scan.

I can't help but like it -- it boils down I guess to the human interface. Easy to see, understand, and control.

cheers

Other advantages of the PRO-92 over the PRO-94 include:

- LTR trunk tracking
- ability to scan both coventional and and trunked systems
sequentially
- CTCSS squelch
- real time CTCSS tone display
- DCS squelch
- real time DCS tone display
- attenuator
- ability to change mode
- multiple step sizes
- "speed loader" battery tray

Watch for PRO-92 and PRO-94 reviews in Monitoring Times magazine.

I really hate to add fuel to the flame war, but several years ago I went to one of the many local Rat Shack[You have questions and we haven't got a Clue!(sm)] to buy a small box for a project. When ever posible I do not patronize them. But I wanted to finsh this little dodad. Bought the box, and follishly was caught offguard when the "May we have your name etc" was sprung on me. So I answered. The goomer misunderstood my first and last name.
The wife and I thought the msitake was funny. About 6 weeks later junk mail from 3 different financial services started showing up. The deluge expanded and ended up with a advert for a swingers club. The mistake is an uncommon variation on my common first and last name. I hope that I may be forgiven for suspecting that, since I had a receipt form the RatShack with that mistake, and the mailings only came after that mistake that they are somehow related. Perhaps the store manager or other loyal employee decided to skim off names and sell them, or perhpas tandy sold them. The fact remains that we still occasionaly get junk mail addressed to that person. IT has been an educatioon to see how sold names filter down through higher vlaue to lower value "suppliers". Like anything else,
fesh names lsits must coast more than older stales lists.
It is your name, your privacy so do what you will. I bnow make what few purchases I that I do under a local skunk, er I meant political types, name. I sure hope he enjoys the spam diet.
The last time they wanted my email address. So I was even more inventive.
Once bitten I am always prepeared the next time I meet a biting dog.
YMMV

Since this a scanning group, and since I have a receiver that will tune
that high, I have often been amazed at just how far microwave oven radio
waves travel. Like over a mile in some cases.
And just you try to explain to your wife why you can listen to ovens.
Although that has convinced her not to stand too close to the microwave
when using it.
And also because of that experince I bought a for real, comercial 2.4GHz
dosimet/leakage detector that I use on ours, our families andfriends
ovens several times a year. Labor Day weekend we found a friends new
Sharp oven would peg the leak detector 10 feet away. He exchanged it
and the next one had the lowest leakage I have ever seen.

Seems like the real show stopper is that

3) Can scan conventional and trunked

whereas it is my understanding that the Pro-94 is like the 235 in this
regard.

However I do have a big problem with the fact that (for the price) the
92 doesn't have fewer holes in it's frequency coverage.

Radio Shack's high-end models usually do not go on sale for a long time. The low and mid-range models go on sale frequently. In the case of the Pro-94, I think they knew they made a pricing mistake. At full price, very few people would buy it over the BC245.

Maybe Jeff can remember the history of the top RS handhelds and how long it was before they went on sale. In my mind it seemed like about a year, but I don't follow it that closely (that, and I usually buy base scanners, not handhelds)

I doubt the antenna is the problem.

>I get 50/50 results using an RS-2026 scanner with a 3db high gain high band
>antenna (Larsen or Maxrad) with a pre-amplifier hooked up to it. I get
>rather poor reception even with the pre-amp. I also get a background
>shushing noise.

Have you tried removing the pre-amp from the antenna? Many times,
particularly is urban or suburban areas, a pre-amp is more of a
hinderance than a help.

>What I would like to know if there is a rather inexpensive external scanner
>antenna that I don't have to mount to a piece of aluminum?? or something
>that I can dig a hole in the ground and put a pole with an antenna on top.

The higher the antenna, the better the performance. The only other
suggestions I have are either A) use better feedline if you're using
more than 20' or so, and B) invest in a better scanner.

Good Luck!

Greetings folks..

Further, I don't see that these devices will do very good in the cordless telephone market since penetration through walls etc. will not be very good. The only value I can see for this is potentially being a bit more private up at these frequencies as opposed to 46 MHz or even 900 MHz. However, propagation at 46 MHz is excellent. The ticket is to get a cordless that in encoded (scrambled) at this frequency so the 'snoopers' can't understand the conversation. Certainly the price is right..

Next time you get a chance notice how high (in frequency) the "UHF" frequencies go up to. Is it actually a microwave oven or is it in reality a UHF oven..

Cheers,
Gary

Sadly there are times that RatShackis the only fast source of parts.
I try to keep a good stock of the junk that I will need, but every now
and then I need a case or some other simple component and it is either
wait until the mailorder can deliver it. IT is hard for them to screw
up a project box. And when you get that wild hair and have to build
soemthing "right now".......
YMMV

2984. Re: Which is better??BC80XLT or BC120XLT??

>Which is better??BC80XLT or BC120XLT?? hello i am a newbie to scanning
and
>was wondering which of these two scanners is better. any help will be
>appreciated. please email me with any suggestions. thanks.

Hi!
The 120XLT is better:
- it has a greater frequency range: 66-88, 108-137(Aircraft/AM), 137-174,
406-512 MHz
- it has 100 memories to store selected frequencies
- it has also 10 priority-channels for steady surveillance
- it has also a "turbo-mode" --> 300 channels /second !!!
- lock-out (skip selected channels), delay-function and data-skip
(surpresses data-transmissions) inclusive!

My personal rating: It is good for beginner. I was also beginner and I
started with the 120XLT because of the good price. Now scanning has become
my favourite hobby, so I'm going to buy a better (station-)scanner. If I had
the chance to start the hobby again I would have chosen a much better
scanner from the start (because of more functions, higher
sensitivity/selectivity and so on). So I would have saved the 250 DM (about
$140). But who knows future... ;-)
So if you know you will spend much time with scanning, than buy a *good*
station-scanner such as the Albrecht AE100T (25-1300 MHz, 500 memories,
about $390) or the Yupiteru MVT 8000 (0,5-1300 MHz, 200 memories, about
$360).
Otherwise the 120XLT is a good and reliable handheld-scanner with a very
good price/performance!

Greetings from the German scanner community at de.alt.radio-scanner!

Happy scanning
Sebastian

PS The AOR AR5000 would be the scanner of my dreams (5kHz-2,5 GHz) and
around $3500. But only "by the way" ;-)

RG58 is fine for that length (as long as there is nothing wrong with the cable - make sure there are no shorts around the connectors like stray braiding touching the center conductor).

For 42-50MHz reception, you really need a big antenna. Antennas cut for VHF/UHF often do very poorly that low. Something about 5 to 7 feet long is usually needed unless you are very close to the source.

150 - 170 MHz is usually very easy to pick up with a bent coat-hanger because the signal strength is high. Most any antenna should do the trick. If the signals are distant, you may need an antenna that is tuned to the band you want. A ground plane with radials allows you to mount it to anything - it does not need to be grounded to anything.

One more possible solution is that your scanner is getting over loaded by a near-by transmitter causing it to become deaf on the frequency you want to hear. If you hook up a small antenna to the back of the radio (back-of-set antenna), and the problem goes away, overload is likely your problem.

Brett - N7OLQ

Anybody have any comments about the Pro-2050. Good, bad, indifferent. I see RS has it on sale and I would not be suprised if it is discontinued in the not so distant future. Love those clearance prices! I am particularly interested in the trunking performance.

I love the Liberty Net...I love all the jammers that jam it. They are all
together in one or two places on the band. What would be bad is if all the
jamming spread out...a jammer is a jammer...thats how they get their kicks.
If the net wasn't there they might just bother me.

You know, that's the exact opposite of what I felt about Scanss, it is hard
to use, hard understand and hard to control. IMHO, it's not even ready for
an initial beta. I really like the features and graphics of WinScan and
find it much more intuitive, easier to use and understand with it coming
much closer to a standard "Windows" interface. I went ahead and ordered a
licensed copy of WinScan, I'd rather pay money for something that works
reasonably well than get something flaky and hard to use, even if it's free.
But hey, whatever floats your boat. :-)

From: Bob D <bob1414@nac.net>
Message-ID: <92MV3.596$bh7.55963@nntp1>
Source record: 102888

The antenna is about 10-15ft high. I have really no choice without spending
a ton of money too mount it to the aluminum. The hissing noise is killing
me.

Not sure how to get rid of it. I use a 3db high gain high band antenna.
They are excellent scanner antennas, because they receive really well on the
150-170 range and because of the longer whip, receive just as well on 42-50.

2996. Programming rail frequencies

Newsgroup: rec.radio.scanner
Date: 1999-11-08 00:00:00 UTC
From: Aric West <slake@netins.net>
Message-ID: <3827A4CF.7F216E7A@netins.net>
Source record: 102891

I've got a Uniden SportCat 150 I plan to use on an Amtrak trip in January. Which would be better? Scan all the AAR frequencies or program them into banks in the order that I encounter them and use only a couple of banks at a time.

I found a couple of web sites with the freqs for the Amtrak runs, but some of the information is in conflict.

I'm thinking I should plug in the whole shebang.

Also would like to know what non-AAR frequencies I should program?

Thanx.

2997. Re: discone wideband scanner antennas

Newsgroup: rec.radio.scanner
Date: 1999-11-08 00:00:00 UTC
From: Iden <iden@ncwebsurfer.com>
Message-ID: <382735a8.0@nntp.quiknet.com>
Source record: 102892

Interesting post. My guess on the frequency response
of the antenna is what you found. It is my understanding
that the low end cut-off freq is whatever the bottom
elements are (1/4 wave). I think some advertise
that they transmit on 6m. If that is the case, the low
band element is at the top of the low band. I know that
a 1/4 wave GP at 42 MHz works better than the typical
scanner discone at 42 MHz.

> Regarding the Radio Shack discone:
>
> The frequency response is VERY flat from about 100MHz to about 1.3GHz.
> I put one on an HP network analyzer and swept it.

I continue to wonder why they are made to start at about
100 MHz and not 118 MHz. Any ideas????

> The elements are stainless (not aluminum), but they are hollow, and
> they are crimped onto stainless-steel threaded studs. Be careful,
> they break off of the studs very easily (first-hand experience).

Me too!

> The whip in the center is pretty useful, if you do anything at 50MHz.
> It can be tuned to a pretty broad range, with an SWR less than 1.5.
> I can't help but think that because this is sold primarily as a
> *scanner* antenna, that the whip was added for those who might be
> inclined to scan cordless phone frequencies.
>
> The whip (or anything else we stuck in it's place) had ZERO effect on
> the response anywhere above 100MHz)

Very interesting to know!!!! Thank you.

> There is a significant gap in coverage at the low end, i.e. there's a
> peak at 50MHz, then a dead zone, then the discone itself comes alive
> from about 100M to about 1.3G

That makes perfect sense as I see it. They advertise 25-1300 MHz
but that is not true.

> I was skeptical at first, but now I think it's an excellent value. In
> theory, it shouldn't have the gain of the Channel Master, but then
> again, the RS is totally flat. I don't think the CM is.

"Totally flat" may not be a positive thing for the average listener.
He / she may want some gain in important bands.

> My solution is to put in a wide-band head-end amplifier.
> So far, it's working great.

Which preamp do you use? Any info would be appreciated.

But you must also realize that maybe it is not his site but your connection to the net or better yet your ISP's connection to the site?

I have a cable connection in Ontario Canada and I found his site to be as fast if not faster than most sites.

I also have a few people I help with their internet stuff and maintain 2 dial-up accounts here with 2 different ISP's in 2 different cities. After seeing some of the complaints about his site being slow I checked it with my cable connection and found it to be very fast, pages loaded fast, files downloaded fast, no problems at all.

Just to be fair I also dumped my memory cache and cleared my hard-drive cache and re booted the system. I then tried a dial-up connection and found it to be as fast as could be expected for dial up.

I also did the same thing with the second dial-up, cleared all caches and re booted and found it to be just as fast.

I also tried this at 3 different times, 8:00AM EST on a Sunday morning and at about 1:00PM EST on a Tuesday afternoon and again at about 9:00PM EST on that same day and the only difference was that all 3 were a little slower in the evening than the afternoon and the afternoon one just slightly slower than the sunday morning one, but no where near enough to tell the man that his site is slowwwwwww!

People must realize that when you use the net at peak hours in your country or area that you could get slow speeds, if your route to a site goes through an area that is very busy you could get slowed down there.

It seems that it is always the same people that complain his site is slow, maybe these people should look at there own connection if they always find some sites slow, do a ping and a trace route and see where the bottleneck is.

I had a problem connecting to a certain site over my cable connection and yet a dial-up had no problems, did a trace-route and found that the dial up had 4 less hops to the same site and was otherwise almost the same route my cable took, the ping showed at these 4 extra hops was giving me either timeouts or times like 500ms 635 ms and one was actually 883ms, I tried this at various times over 3 days and always the same, long pings or timeouts, called the ISP locally here and complained and they tried it from their end and same thing and said that was a problem and would look into it, now when I do a trace-route on the site I have a completely different route and it is a hell of a lot faster and I have not had problems since then, what I think has

happened is that routing was changed and I got out of their network
sooner and the spot I got out was messed up now I stay in the ISP's
system longer before getting out.

Just my 3 cents worth.

Cheers

Len

Pressing simply toggles it on and off. Pressing and holding for about
two seconds is what's needed to reprogram.

> Also, on my dad's BC-60XLT, the manual says that you can turn all
> locked out channels back on by pressing L/O for 2 seconds. This

Don't think so.

> Finally, is there anyway to store one or more search ranges?

Just one.
Key in lower limit frequency
Press LIM or LIMIT
Key in upper limit frequency
Press LIM or LIMIT
Press SRCH or SEARCH

What CPU does your old note book run? If it is not at least a 80486-50,
with 16 meg of RAM the Icom control program will just creep along.
While I have the PCR1000 I have used a friends PCR100 and the stock control
program is much better than the on that came with mine. But it does require
some horsepower to run.
It will run with a slower CPU and with less ram, just slower. This will lower
the already too slow channel scan rate. While I do not remember off hand
what it is, even on a fast (P233) it is slower than my stock Pro2004. Channel
scab rate is not everything, but it is somewhat important. The PCR100 is
about as slow as is acceptable in my opinion.
It is a good radio, the SW coverage suffers form a lack of SSB and this does
rob you of some VHF utitility in that you can not listen to ham SSB/CW, but,
for most folks that might be a blessing. I listen to a lot of wierd stuff,
such as the 468 GOES east and west stellites and SSB is usefull in finding
them during the initial pahses of antenna construction. In SSB mode on a
stock old Tandy diskcone I can jusr detect the carrier from GOES WEST. But,
for most people the lack of SSB/CW and DSP will not be much if any of a loss.
Good listening!

I will try to dig out my diagram and post additional information.
The battery should be isolated by a diode that is reverse bias so that
it is effectivly out of cirucit. I use bunny batteries (NEVER EVER USE
RAT SHACK BETTERIES IN ANYTHING THAT YOU VALUE,,,THEY WILL LEAK!)and
they last several years. I have thought about either putting a 9V nicad
(they are really 7.25V) or even removing the battery and going with one
of those big (1 Fared)backup caps that Kenwood, Panasonic and Fisher
used in early 1990 equipment. I also have an Icom IC-28A and a Kenwood
R2000 that used CR-3022(or was it CR2032) 3V Lithium button backup
batteries. The R2000 got hungry and started eating them at the rate of
1 per month (or I got a bad batch of batteries) so I replace the Li cell
with a 1F cap. Rigged a voltage devider to reduce the +12V to + 4V,
isolated the cap from the devider string with 2 1N914 Si diodes and
it will keep the R2000 up for at lest 30days. It should go much longer,
but that radio never is off for longer. Shortly after that "upgrade",
the IC28A Li cell failed. So I did the same mod to it. It has been off
for at least 6 months (did I mention that while I am a ham, I almost
never talk..scanning and SWL are much more fun IMO). I got the idea
from this news group after reading someone elses post on this topic
several years ago (thank you whoever you were). I have also fixxed my
Tandy TRS80, model 100 (the on board nicad pack was flakey) and I have
just completed my Zeos Pocket PC [an almost poket sized PC that will
control my GPS/PCR1000/MFJ1278].
These nice little caps can be found in a lot of older Kenwood comercial

setup boards. They came from the factory with 'dumb" control boards
and had to have smart one installed to be usefull, panasonic VCRs,
Fischer tuners (FM BCB/MPX) or failling those sources, DigiKey sells
them.
If you Pro2004 stays connected to the power all the time, and that power
is never interrupeted. This would require the radio to run from a +12V
external source, not the internal AC supply, you could just clip one
resistor [details will follow]to mute the beep. But each and every time
the power was interupted you would lose all memory. The radio will
"coast" for a few [30] seconds before the memory dies, but it is a pain
to have to reprogram everytime the lights go out or you move the radio
form house to car.

3019. Pro 92 Audio ?

Newsgroup: rec.radio.scanner

I recently purchased a Pro 94 from Radio Shack. I kept it less than one day!

The audio HISSED so bad I could not stand to listen to it.

I will buy a Pro 92 as soon as I can find one.

Do you know how the audio sounds on the 92?

I have both the bc245xlt and the pro92(5days) while the 92 is a little bit harder to learn and program , it has more channels,can scan both trunked and conventional at the same time, has alpha numerics , can scan motorola,edacs and ltd. in the trunked mode. It also has P/L capabilities. You can get the 92 for 350.00 or the 245 for as little as 200. Matter of choice.Neither has military air , the 94 does but it can not scan both trunked and conventional at the same time, big drawback.

Whoops Bob
Be honest <wink>

The modes you listed below as advantages in the PRO 92 are mutually exclusive, aren't they?
You can only do one at a time. LTR, EDACS, PL (CTCSS squelch), DPL (DCS squelch)
But you already know that.

Also the speed loader battery pack, unless it is of a better design then the system they used a few years ago, will fail if there is any case distortion in the radio case due to dash board heat in the summer time. Ouch! The method used to store batteries in the PRO 94 looks more like ham radio quality then the method used in Uniden's own BC 245 XLT.

IMHO the PRO 94 is a fairly big bang for the buck at $199 or less. You can download WEB coupons that reduce it's net cost from Radioshack.com. These also can be used on the PRO 92.

Other than that I am looking forward to your hands on review.

I have had my 92 for 5 days and still can't get it to scan the trunked stuff right in the closed mode. I probably am missing a step and will keep working on it. but I miss the scan lists the 245 has. Incidentally I am keeping both. At least the 92 has alpha-numerics and P/L capabilities that the 245 doesn't .

3029. The LAFD asks you: What is a Vet?

Newsgroup: rec.radio.scanner
Date: 1999-11-09 00:00:00 UTC
From: Brian Humphrey <brian.humphrey@prodigy.net>
Message-ID: <80a8fi$4hdi$1@newssvr04-int.news.prodigy.com>
Source record: 102752
Cross-posted to: alt.radio.scanner,alt.tv.emergency,rec.radio.scanner

The Los Angeles Fire Department takes pride in its credo:

"...at all times, service above self".

There are times however, when our efforts - no matter how valiant - should be
rightfully overshadowed. One such time is this Thursday. Please join me in
taking time to ponder the following question...

WHAT IS A VET?

Some veterans bear visible signs of their service: a missing
limb, a jagged scar, a certain look in the eye.

Others may carry the evidence inside them: a pin holding a
bone together, a piece of shrapnel in the leg - or perhaps another sort of
inner steel: the soul's ally forged in the refinery of adversity.

Except in parades, however, the men and women who have kept
America safe wear no badge or emblem. You can't tell a vet just by looking.

What is a vet?

He is the cop on the beat who spent six months in Saudi Arabia
sweating two gallons a day making sure the armored personnel carriers didn't
run out of fuel.

He is the barroom loudmouth, dumber than five wooden planks, whose overgrown
frat-boy behavior is outweighed a hundred times in the cosmic scales
by four hours of exquisite bravery near the 38th parallel.

She - or he - is the nurse who fought against futility and went to sleep
sobbing every night for two solid years in Da Nang.

He is the POW who went away one person and came back another -or- didn't
come
back AT ALL.

He is the Quantico drill instructor that has never seen combat - but has
saved
countless lives by turning slouchy, no-account rednecks and gang members
into
Marines, and teaching them to watch each other's backs.

He is the parade - riding Legionnaire who pins on his ribbons and medals
with a
prosthetic hand.

He is the career quartermaster who watches the ribbons and medals pass him by.

He is the three anonymous heroes in The Tomb Of The Unknowns, whose presence at
the Arlington National Cemetery must forever preserve the memory of all the anonymous heroes whose valor dies unrecognized with them on the battlefield or
in the ocean's sunless deep.

He is the old guy bagging groceries at the supermarket - palsied now and aggravatingly slow - who helped liberate a Nazi death camp and who wishes all
day long that his wife were still alive to hold him when the nightmares come.

He is an ordinary and yet an extraordinary human being, a person who offered some of his life's most vital years in the service of his country, and who sacrificed his ambitions so others would not have to sacrifice theirs.

He is a soldier and a savior and a sword against the darkness, and he is nothing more than the finest, greatest testimony on behalf of the finest, greatest nation ever known.

So remember, each time you see someone who has served our country, just lean over and say Thank You. That's all most people need, and in most cases it will
mean more than any medals they could have been awarded or were awarded.

Two little words that mean a lot, "THANK YOU".

Remember, November 11th is Veterans Day.

One fine man probably summarized it best...

"It is the soldier, not the reporter, Who has given us freedom of the press. It
is the soldier, not the poet, Who has given us freedom of speech. It is the soldier, not the campus organizer, Who has given us the freedom to demonstrate.
It is the soldier, Who salutes the flag, Who serves beneath the flag, and whose
coffin is draped by the flag, Who allows the protester to burn the flag."

Father Denis Edward O'Brien, USMC

Stay Safe!

Thanks for this reminder, Brian.

As my husband is in the airforce (and his father before him), we take
the 11th hour of the 11th day of the 11th month quite seriously. He will
be marching in the local parade on Thursday and I, along with a great
many businesses, organizations and people in general, will be observing
the 2 minutes of silence to remember.

Please remember what Remembrance Day is for....lest we forget...

I hope that your family enjoy the parade, and my thanks for your husband and
his father for contributing to the Air Force.
Hopefully, you can enjoy this moment more than Memorial Day, where
the occasion is more solemn with regard to respecting the soldiers who
lost their lives. I'll remember. May your children never need to serve
in wartime.

155.19 is Contra Costa Sheriff p East county. I use narrow FM, of
course. The problem exists at every frequency i tested in the VHF
15x.xxx band . image always occurs at 910 kHz lower.

Check out the new RS catalog---- Pro-2052 trunking, edacs and milair. It
says in the catalog that it isn't available until Nov.15, but if you order
it and have it delivered to your hose, it will probably be at your door
before the local RS can get one in.
I ordered mine today!!

29-54, 108-512, 806-960 (cell/ blk), 1240-1300 Mhz
follows Motorola i,ii,i/ii, and Ge Ericson(edacs) trunked systems
built in RS-232 serial interface
20 priotity channels
Data skip and search skip

mike
no, i don't work for RS, I just happened to have the catalog right here!

Yes and microwaves are sometimes bounced off passive reflectors.
Uhf at 450 or 800 mhz tends to reflect around corners and actually works
very good inside buildings.
In the same places a Vhf signal would be unuseable.
Go behind a big hill and you will find very little signal left from Uhf and
at this point it is possible that Vhf might be better in edging over the
hill.
Ham radio and commerical radio experience will prove this to be a fact.
Rick

I agree with you 100%. If you notice, the one's that always have a smart a** comment usually are always purchasing something from RS. Also realize how much knowledge and expertise you would have to have to be proficient in every single product or item they sell. It would proboably take months and months maybe years of training and it is just not practical from a retailers stand point. I am a licensed amateur radio operator, and I have spoken many times to the so-called specialty ham electronic/radio stores that could not give me specific details/information about a particular product they had advertised in one of their catalogs. In fact I have dealt with many types of retail operations that were not be able to answer a particular question about an item they were carrying. I have two choices: continue to shop there and research the question or item myself or don't shop there. It is really that simple.

>once. Specifically, I want to be able to simultaneously listen to 2
>frequencies in the 160 Mhz railroad band.

Do you actually want to receive both signals simultaneously, if both bands are active? Or would it be adequate to listen to just one of them, as long as both frequencies are monitored for activity when both are idle?

True dual-receiver radios like the FT-51 will actually monitor two frequencies simultaneously, playing the audio from both. In the case of the FT-51, you have to set the "UHF" side of the radio to a VHF frequency, and it will do that - but its sensitivity is probably worse than the side of the radio specifically designed for VHF. That's likely true of most such radios with "V+V" receive.

However, I find hearing two signals simultaneously confusing, so I have my FT-51 set to "mute" - this kills the audio on the "sub" receiver if there is activity on the "main" receiver. So if both channels are active at once, the only indication I have of that is two green LEDs and two active signal strength meters - I can only hear the one signal.

And if only hearing one signal at a time is OK, any scanner and most single-receiver HTs will let you scan between two frequencies looking for activity.

Dave

3045. Re: Quit you crying about the Shack!

Newsgroup: rec.radio.scanner
Date: 1999-11-09 00:00:00 UTC
From: Robert <rc123@globe-net.net>
Message-ID: <3828E956.B9D01623@globe-net.net>
Source record: 102768

Norman,

Interesting comments. Here's my view... While in college (working
on an Associates degree in Digital Electronics), I applied for a job
at the local Radio Shack. I literally knew more about the products
than anyone working there. I had bought most of the electronic parts
and many of the electronic appliances being sold. I knew the layout
of the store and never needed to refer to a catalog to see if they
carried that product. Since I was paying for my own degree, I needed
to supplement my income. The manager knew me for several years
by name and I was surprised to be told that it was store policy only
to hire people with SALES experience. I reminded him of my technical
background and I was then hit with "NO TECHNICAL EXPERIENCE
REQUIRED". Even now, with 16 years of experience in the Aerospace
industry, I'm still not qualified to work at the Shack. No, I don't whine
about it but I will say that the comments of "work on the other side of
the counter" hit home a little. Some of us have tried, we just weren't
qualified! So when you see someone in their mid 30s grabbing handfuls
of components from the walls and a smiling Shack representative walks
up and asks "can I help", don't be surprised I they answer "I don't
thing so, but thanks anyway"... then smirks to himself. Not an insult
to you or any salesperson in the industry. Just I don't agree with their
policy and I truly believe it hurts the store. I'd just be happy if they'd
stop trying to sell me a cell phone, long distance telephone service,
extended warranty, etc., etc., each time I went to buy something
that I had forgotten to mail order from Newark, Digi-Key, or even
the new RadioShack.com (was TechAm). ;-)

Remembrance Day is taken very seriously here too. My uncles served in WWII and one went down over the Bay of Biscay at the ripe age of 21. He bore an uncanny and spooky resemblance to my older brother. I shiver every time I look at his picture. They are true heroes in every sense of the word. I am forever grateful to the people who sacrificed so much for our freedom.

From what I've seen most of the Amtrak frequencies are used around the
stations and such. On the road the main traffic will be on the local
railroad's road channel.
>
>I'm thinking I should plug in the whole shebang.

Might be the most direct approach. It depends on whether you can find the
road frequencies for all the roads you'll be running on.
>
>Also would like to know what non-AAR frequencies I should program?

457.9375 MHz - FRED (Flashing Rear End Device) It's a transmitter on the
rear of virtually all freight trains in the country. It only produces a
short chirp every 30 seconds or so. It will alert you to an approaching
freight train (hopefully on the other track).

Wow! Great info, but I had a hard time viewing or downloading it.
For some reason, the URL is split into 2 lines (see your post to this
newsgroup), and even when I corrected this and tried to open the
corrected URL the file was too large to view in Netscape (it crashed
Netscape, although I DID manage to view the first page).
It seems Netscape doesn't support downloading a document directly
(which isn't a valid link on another HTML page) and also splits lines
on very long URL's..
Any ideas how to download it without opening it?

Thank's a bunch!

Thanks and best regards,
T-man

Note: when posting a Reply, please send me a copy

HUGE disadvantage!!!

I'm still trying to find out if you can scroll or step through ID's while in "ID HOLD" mode. Does anyone know if you can go into ID HOLD and then use the arrows or something to manually move from ine ID to another?

Radio Shack may not give out your name, but others do. As an earlier post said, simply misspell your name, give them a fictious middle intial or something and make a note of it , then you got them by the balls.

>trunking capabilities.

I tested a PRO-2050 and published the results in the
May 1998 issue of Monitoring Times magazine. Here's a portion:

Usability and Performance
"The LCD display is easy to read and brilliantly backlit
by an incandescent bulb through an orange filter. The lighting
scheme is simple yet effective -- the same as in the PRO-2040.
We prefer it to the PRO-2006-type electroluminescent panel
which wears out with use and is expensive to replace.
The volume and squelch knobs are too close together and
it's difficult to adjust one knob without a finger bumping into
the other knob. The rubber keypad has a good feel and a
keypress confirmation beep can be enabled or disabled via a
power on procedure. The tiny keytop lettering of the center
keys has us squinting. The Manual key is perhaps the most
important key in any scanner, but it is small and the same
color and shape as most other keys on PRO-2050's central
dashboard (fig. 2).
The PRO-2050 is lightweight because there is no
chassis and the case is entirely plastic. Power is furnished
by an included 12 VDC wall wart. Components are surface mounted
on a main printed circuit board and a second board located
behind the front panel. We connected a CTCSS display to the
discriminator using the solder pad shown in Figure 3,
though this may void the warranty.
The triple conversion PRO-2050 employs IFs (intermediate
frequencies) near 380.7, 10.85 and 0.450 MHz and the image
rejection on our test unit is excellent at the frequency
we measured. Our PRO-2050 reception is starkly "cleaner"
than most of the other middle priced scanners we tested.
It isn't plagued by intermod or image problems in the 160 MHz
railroad band nor most of the spectrum while using an outdoor antenna.
We find relatively few birdies in our PRO-2050. Harmonics
of the crystal controlled 10.4 MHz local oscillator are responsible
for birdies at 31.2, 41.6, and 52 MHz, though they are weaker
than the same birdies in our BC235XLT.

Audio output is crisp. Monaural headphones or an external
speaker can be connected through a 1/8" jack on the front panel,
but there is no Tape output jack.

Finale
Though its front panel could be better, our PRO-2050's
reception is excellent. The PRO-2050 is a fine match for the
person who wants "meat and potatoes" trunk tracking and
conventional scanning without frills or a lot of intermod."

My lab test results appear in the MT article.

Reprints of articles from Monitoring Times are available
for $3.00 each plus a self-addressed stamped envelope from:

Uh, I thought penetration got better with higher frequency. That seems to be the premise of comparison ads between VHF and UHF walkie-talkies over the last 5 or 10 years. I thought that the shorter wavelength made it less likely for the signal to be disrupted by obstacles and objects.

I can tell you that my 460MHz FRS walkie-talkies seem to go through walls very well.

Sometimes, if I'm not in the local RS I frequent, when they ask me for my name, I'll say "Uh, why do you need that?", then I'll point up over their shoulder and say, "That's not a camera, is it?" and then start looking around nervously.

Good clean fun.

That's correct, the higher the frequency, the better the penetration. The signal becomes more directional however.

Greetings Jeff..

Along with Fredrick's comment:

"That's correct, the higher the frequency, the better the
penetration.
The signal becomes more directional however."

In actual practice, I think you would find that this is not the case for man made buildings or other shelters. Otherwise we wouldn't need to locate our satellite antennas outside specifically aimed at the satellite. I have experience at 23cm RF communications and the drop-out can be most pronounced where as VHF has no problem within the same area. Keep in mind that we're not talking about concentrated RF in a cavity but attempting to have a very low level signal pentrate walls, masonery, brick and steel structures etc. - and at these frequencies and power levels, you will find that RF propagation won't be what you had expected. Further, in wet or high humidity climate the problem only worsens.

Cheers,
Gary

I believe you are mistaken.

In general practice, the higher the frequency, the LESS penetration will occur and you will get better performance in a line-of-site situation.

Take, for example, microwave links. They are always line-of-site directly because of their 2+Ghz frequencies.

The military tech antenna book that I had (loaned it out grrrr) said
something to effect "the lowest frequency is where the vertical distance
from the top radials to the bottom equals 1/4WL. And the hightes
frequency is the shortest vertical heigth" I do not have the measure
ments that I did on my Tandy diskcone, but they agree real close with
what the book said.
Now I have used the diskcone for listening to SW, even AM BCB. While
I will be the first to admit that almost anything will work better, it
does work better than I would have thought down that low. A friend
bought a SW and did not have time to erect an antenna. We were
conspiring on the telephone on antenna designs when he asked (to the
effect)"what will happen is I use the disckcone for SW?". My answere,
straight from a text book, is "nothing, it is way to short."
Boy was I surprised when he connected it and got all the major SW
signals. Not the best, but in an emergency, like when an ice storm
killed my wire antenna, it allowed me to keep up with the world.
While scanning is fun, SWL is my life.
YMWV

I have taken many trips on Amtrak with my scanner. My suggestion is that you find out what company owns and operates the rail(s) you will be on. For instance, if you are going from Cleveland to Chicago then you are on NS trackage. Therefor, you should program all of the NS frequencies. Amtrak uses the frequency of the railroad they are operating on. Oftentimes, they will switch channels as they switch on to a different railroad. ie: changing from CSX trackage to Union Pacific trackage in say Chicago will require the crews to change channels.

Here in the SF Bay area, listening to the OES White channel (154.280) on my AR8200 was very irritating since a local busy sheriff channel on 155.190 came in loud and clear on 154.280 -- some 910 kHz away. (2 x the IF freq of 455 kHz). On the Pro92 however, no such problem! Thank you RS!! Got my Pro92 from Gelnn at Scanners unlimited just yesterday.

Neil Bell

Hmmmm....somehow, I seem to have missed this entire thread and was
rather surprised to find this reply in four different newsgroups to
which I am subscribed. Apparently, my ISP has room for improvement.

KNY2VS is a monitor station registry issued by CRB Research in
Commack, New York on February 6, 1988. I do, in fact, have a ham
license (my call is KC2FNG), but for me, amateur radio is not the
alpha and the omega of my involvement in the radio hobby as is the
case with some people. There are hams who are hams only, there are
other hams who happen to enjoy SWL'ing and scanner monitoring and so
forth. Me, I'm into a lot of things - CB, SWL, Scanning, AMBC DX'ing,
and ham radio as well.

I was an SWL, CB operator, and registered monitor long before I ever
got a ham ticket. I know of some other guys who are hams who also
happen to be registered monitors. Me...I'm a registered monitor who
also happens to have a ham license.

I do appreciate the favorable comments from those out there who
understand that radio is a multi-faceted hobby and that there are many
different interests within radio for people to enjoy. As for the
people who sounded off about my use of my monitor registry I.D.,
well...I'm not going to waste bandwidth replying to people who
criticize something that they obviously know nothing about. :-)

73 and good DX'ing,
John D. Kasupski
KC2FNG, KNY2VS, KJK-14120, KSO-9650, AE279

Does anyone know how to get in touch with the manufacturers of a line of scanner antennas called "Max Antennas"? The manufacturer went by the name of Cellular Security Group and was based on Glouchester, Massachusetts. The last time I had contact with them was about four years ago. Thanks.

Yes. The 9000 is Uniden's top of the line model. Besides the inability to trunk-track it blows away the 895 (I've got both). Strangely, it looks like the new top of the line model will be the 780 mobile, due out next year.

I'm looking for my first Trunk scanner and want to get options on the Pro92 and Pro94 models. And before you say it, I've had BearCat (Uniden) scanners in the past and really don't like them. I've had RadioShacks and like them!

Next question, does anyone make a Trunk Scanner which also covers MilAir freqs? MilAir is my primary listening.....

I really like it. Easy to use, pretty good sensitivity, loud audio --
everything is great about it. Plus, it's fairly easy to install in your car
if you decide to make it a mobile scanner (like I did). I would recommend
it, especially if it goes discontinued.

What ever a person thirsts for; some one, some group, some religion,
some business, has a drink. Many create the thirst in order to *sell*
the drink. There are a lot of thirsty people in the world. Nothing to
be amazed over, pretty basic stuff.

The best things in life are free and ungoverned. Right now I need a
cold Bud. Toot'a'loo.

Yes, I saw that. Congrats. I'm always amazed at what stuff sells for on eBay. Used stuff often sells for the same or MORE than you could buy it NEW! I guess people just don't know how to find bargains.

<snip>

Hmm,,, You've got as much experience in the Aerospace industry as most
RS employees do at living. Okay, so they've got to be 18 years old, at
least. But, sales experience? Things must have changed since you
checked with them. :-)

No, I'm not knocking the employees. Everyone's got to start somewhere.
Almost all of them move on as soon as they gain experience and
knowledge. (I've helped train my share of 'em! <G>)

Bob are you saying you got the PRO 92 to scan in CLOSED MODE the ALL the ones you listed. That the bank also included a trunked system. And that it did both DPL and PL at the same time as it trunktracked in this bank?

How did you do that?

Remember the question refers to closed mode where you actually benefit from having PL/DPL capability.
Open mode merely determines what type of signal is present.

Vic

BTW a PRO 94 FAILED a test of ALERTING on SAME while scanning today at 11:35 AM EST within 6 miles of the NOAA transmitter on Stone Mountain GA. What a disappointment!

Here's something I found today and really liked. It expresses my feelings perfectly. I hope you all like it as much as I do.
Brandywine

JUST A SIMPLE SOLDIER

He was getting old and paunchy and his hair was falling fast,
as he sat around the Legion Hall telling stories of the past.

Of a war that he had fought in and the deeds that he had done.
In his exploits with his buddies, they were heroes, everyone.

'Tho sometimes to his neighbors, his tales became a joke,
all his buddies listened for they knew whereof he spoke.

We'll hear his tales no longer for ol' Bob has passed away,
and the world's a little poorer, for a soldier died today.

He won't be mourned by many just his children and his wife,
for he lived an ordinary, very quiet sort of life.

He held a job and raised a family, quietly going along his way
and the world won't note his passing -- 'tho a soldier died today.

When politicians leave this earth their bodies lie in state,
while thousands note their passing and proclaim that they were great.

Papers tell of their life stories from the time that they were young,
but the passing of a soldier goes unnoticed and unsung.

Is the greatest contribution to the welfare of our land,
some jerk who breaks his promises and cons his fellow man?

Or the ordinary fellow, who in times of war and strife,
goes off to serve his country and offers up his life?

The politician's stipend and the style in which he lives,
is sometimes disproportionate to the service that he gives.

While the ordinary soldier who offered up his all,
is paid off with a medal and perhaps a pension, small.

It's so easy to forget them for it is so long ago,
that our Bobs and Jims and Johnnys went to battle, but we know.

It was not the politicians with their compromise and ploys,
who won for us the freedom that our country now enjoys.

Should you find yourself in danger with your enemies at hand,
would you really want some cop-out with his ever waffling stand?

Or would you want a soldier who has sworn to defend,
his home, his kin and country and would fight until the end?

He was just a common soldier and his ranks are growing thin,
but his presence should remind us we may need his like again.

For when countries are in conflict, then we find the soldier's part
is to clean up all the troubles that the politicians start.

If we cannot do him honor while he's here to hear the praise,
then at least let's give him homage at the ending of his days.

Perhaps just a simple headline in the paper that might say:
"OUR COUNTRY IS IN MOURNING, FOR A SOLDIER DIED TODAY."

Same goop as used in the BC235XLT and PRO-90. It is an epoxy
material that was applied to prevent hacking. This is a requirement
imposed by Federal law. A solvent strong enough to break down
the epoxy is likely to damage the board or surrounding components.

Hi,

I wonder if anyone out there can help a colleague of mine who has
just purchased an AR2001 at a local Radio Rally.

The top two rows of buttons on the keypad (total of 8 buttons) do
not appear to work.

He's had a quick look and there's no obvious cause for this problem.

This radio came without operating instructions so he'll need to try and
obtain these later, possibly from a dealer. It's not a very new model
but hopefully this won't present problems...

Any help would be appreciated,

Thanks,

John

Victor Healey wrote:
> IMHO the PRO 94 is a fairly big bang for the buck at $199 or less.

With the exception of the use of AAs and 1000 channels (of which you can only use 500 at any one time), why should someone get the 94 and be limited to scanning trunked OR conventional when, for roughly the same price, you can get a BC245XLT which can scan trunked AND conventional as well as having computer control?

People moaned and groaned ad nauseam because the 235 could not do conventional and trunked at the same time. Along comes the 245 to fix this, and Radio Shack has Uniden make them the 94 which is basically a BC235XLT/PRO-90/PRO-91 with EDACS? What's the appeal for the 94 (considering the existence of a simlarly priced 245)?

3126. Looking for Handheld with Dual Receive

Newsgroup: rec.radio.scanner
Date: 1999-11-10 00:00:00 UTC
From: gp@home.com
Message-ID: <MPG.12931cc01807609989686@news>
Source record: 102700
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

Hi...I'm looking for a handheld scanner or amateur radio that has wideband reception capability, and will let me listen to 2 frequencies at once. Specifically, I want to be able to simultaneously listen to 2 frequencies in the 160 Mhz railroad band.

I have an Icom 2SRA, which can do this, but requires 2 antennas. I would prefer a radio that uses only one antenna.

Some of the radios that I think might qualify are the Yaesu FT-51, ADI AT-600, Icom W32. I'm also aware of scanners that have "dual VFO", but I don't know if you can listen to both VFO frequencies at the same time.

Any advice would be appreciated.

Greg Pratt

I 'm going to buy a handscanner but I don't know much about scanners.

I want to use it especially for making emergency calls on mountain trips.
And also just for fun.
What type should I buy?
Is it possible to transmit wtih scanners?

Thanx,

Olivier,

The PRO-94 wasn't really intended to be a product. Rather it is an IQ
test - buy one and you flunk.............

Sent via Deja.com http://www.deja.com/
Before you buy.

Scantenna Mark II Monitoring Antenna

19.95 + P&H

BESTSELLER High Performance Antenna for Handheld Scanners (30-900 MHz)
Stock antennas supplied with many handheld scanner radios are often
so-so performers. You could be missing radio signals your handheld
scanner might otherwise pick up with a better antenna. The Scantenna
Mark II is an 8-in. tapered helical top-loaded flexible high-efficiency
replacement antenna that does a great job on handheld scanners between
30 to 900 MHz. The Scantenna Mark II is a better antenna than many
selling for much more! Suited to all handheld scanner radios having a
BNC-type connector. Does a great job when used with a Super Amplifier.
A CRB Research Books catalog is included FREE with your purchase!

Buy it at Anita's Scanners and Supplies

While the BC245XLT may have advantages over the PRO-94
in features and value, most people who walk into Radio Shack
have no idea that the BC245XLT exists or where to buy one.

The presence of a Radio Store in just about every locale
in the USA assures the PRO-94 and other Radio Shack
models wide exposure.

Replacement membrane/keypads are still available although numbers are
reducing. We have a couple and AOR UK still have some (I believe)

Instructions for replacing it can be found at:

http://www.aoruk.com/2100bull.htm

> This radio came without operating instructions so he'll need to try and
> obtain these later, possibly from a dealer. It's not a very new model
> but hopefully this won't present problems...

You can download the instructions for the AR2001 in pdf file format from
the AOR UK web site:

http://www.aoruk.com/manuals.htm

Hope that helps.
Cheers,

3140. ATS-909 lockup

Newsgroup: rec.radio.scanner
Date: 1999-11-10 00:00:00 UTC
From: jerryg@ravenswood.jf.intel.com
Message-ID: <slrn82j401.tbe.jerryg@ravenswood.jf.intel.com>
Source record: 102714

I've run into an unusual lockup, I think.

Last night, I was lying in bed listening to the radio. In the dark
I tried to find the keys to start scanning. I hit some kind of
combination that suddenly put me into FM. I could change frequencies,
but could not shut off the radio. I finally removed the batteries
to shut it off.

Now it's in some mode that refuses to acknowledge the power button.
Lock works, the clock is displaying a time (though it seems to be
stuck at 16:xx). Reset does nothing.

In frustration, I again pulled the batteries and left them out all night.
Still locked up this morning.

Is it back to Sangean with this?

The PRO 94 cover 216.00 - 225.00 which I believe is a ham band - not mi
air.

PRO 94 frequency coverage:

29-54 mhz 5khz steps
108-136.975 mhz 12.5 khz steps
137-174 mhz 5 khz steps
216-224.995 mhz 5khz steps
406-512 mhz 12.5 khz steps
806.0000-823.9375 mhz 12.5khz steps
851.0000-868.9875 mhz 12.5 khz steps
896.1125-956.0000 mhz 12.5 khz steps
1240.0000-1300.0000 mhz 12.5 khz steps

Also only the 108-1369875 (civ air band) is AM rest is FM.

> help would be great, thanks

Nobody sells scanners capable of receiving cellular bands, or capable of being modified to receive cellular bands. Legislation was passed back in the late 80's early 90's (it was during Bush's term, I remember that much) that made this illegal. Sometimes you can find an older scanner capable of this, but it has to be fairly old.

If I recall, listening to cellular is illegal. I know it used to be legal to listen to cordless phones, but you could not repeat any of the conversations nor use it to your profit. Most scanners today, though, will pick up cordless phones.

Frankly, though, listening to cordless/cellular is pretty darn boring. The police / fire bands are far more interesting.

Robert

The best dual monitor is the Alinco DJ-580! Twice meters + 440 + extended receive to 900 mHz. Absolutely stunning device will blow your freakin mind with it's massive storage and guess what, I just happen to have one for sale. No shit. This is your lucky day my man. 350.00 and it's yours!!

I meant the "super" narrow FM mode, not just regular "NFM". But again
it's unlikely to make any difference in this case. I wonder what the
"repair" policy is... I wonder if there's anything in the way of
alignment that could be done to help the problem. You might see what
the folks down in Los Angeles say (I think that's where they do
repairs?)

I disagree. I think the PRO-94 will work perfectly for some people.
Those are the ones who should buy it. The rest (myself included) whom
this radio does not entirely work for, should not buy it.

It's a simple matter of buying what works for your particular
application. Some if the best scanners don't do everything I would
like but for some they're exactly what they need.

You'd be right if the BC245 didn't exist, but since it does and costs
the same as the PRO-94, it's a no-brainer.

> Once again, loony-toon has been PROVEN to be a liar.

Once again, the Grand Canyon has been PROVEN to exist.

See? It just doesn't have the same effect as an unknown becoming known.

Instead of "This new scanner is a reality" or "this frequency is new"
we have an endless diatribe of "Toilet Boy the liar."

We hold this truth to be self evident.

I honestly don't know which is worse. The mantra chant-rant of "liar,
liar" or the man who refuses to acknowledge his own sickening
condition. Both have become a black eye on an otherwise helpful group.

Bill Conduit hit it right on the head, as I also did, a long time ago.
Ignoring him is the only way to make it go away. Even then, it may not.
It is up to him and him alone to exercise his own self control and keep
the group on the topic of scanners. This is something we cannot change.
He must realize his illness and choose to do something about it
himself. We cannot do this for him. By the looks of things, he is
nowhere near ready to admit his problem and get on with his life. He is
obsessed with Cheek and obsessed with this group. Nothing we say can
change it.

But do you know what happens when you stop responding to his noise? You
stop acting the fool for his game! You spoil the fun by not playing
along! So now he must find a new source to feed his affliction-
addiction. Once enough people catch on, he won't be able to feed his
need in this group, and then he will leave.

Try it and see. No matter what he posts, let it go. No one cares. It's
just words....

Unless you too share his "problem".

Watch. He will do his best to get me to reply to him, now that I've
said this. Once, he even called me at work, when I vowed to ignore him.

You can goad him on all you like and that's fine with him, but when you
threaten to ignore him, ohhh does he fume....despite his claims to the
contrary.

Watch. Try it and see.

Well now. A Vet is someone to be devoutly ignored (and even despised in some places) for 364 days a year. He is then worshipped in total hypocrisy for one day. However,i t is not the LIVING vet that is worhipped. No, dead veterans are much easier to love. Living vets (particularly of the Viet Nam Variety) are far too much trouble to even like while they are still alive ! No, instead, the attention is lavished upon the dead verteran who neither hears nor cares. The dead veteran no longer has any pain or suffering. The dead veteran is not the one living a life totally ruined from the day he became one.

A Vet is someone who is "not good enough to walk our streets" here in Central NAZI Maine. A vet is some one who, if the prosecutor cannot find another reason, will bring up the fact that "His Viet Nam experience plays a role in his "behaviour" on the street, when the man has DONE NOTHING ILLEGAL. A vet is some one who is despised simply for being on that street, that he fought and earned the right to walk down, like everyone else. A VET is someone to be harrased at the polling place, simply because he is a registered democrat ! A VET is someone to be told "You don`t have any constitutional rights, unless we say so !" A VET is someone who gets told "YOU aren`t gonna hang around on MY sidewalks, or you just might DISAPPEAR" by the local cop ! How about this one "I never gave you my permission to move here". "I never asked you to come up here". How is THAT for "respect". from a cop ?
Yes, come on up to Dexter, Maine, and find out how much "respect" VETS get up HERE. VETS up here get sued by the local business for simply being on the sidewalk, on public property at night, when they were hanging around there for 5 years before that business opened, have NO POLICE RECORD WHATSOEVER, and have never done a DAMN THING to that business ! (This was so outrageous that even the nazi SYSTEM up here wouldn`t go for it. The business had to settle out of court !
Yes sir, come on up here to Maine, where vets are 6th class citizens !
This guy was a DISABLED VET, to BOOT ! The Maine Human Rights Comission (A do-nothing organization that is right in bed with the system and taking payoffs from these businesses), Would NOT HELP THIS GUY.
Let me tell you, NOBODY waves that flag higher, than they do up here on their phony "verterans day", parades and all..... If you`re a Viet Nam vet, just don`t show up there ! Otherwise, you`re gonna spend the day in the pokey ! (they`ll think of something to "charge you with")
When people try to run you over, and the cop won`t do anything about them, then you will know what your "life has been worth" to them ! It`s perfectly ok up here to run folks over, AS LONG AS THEY ARE THE RIGHT FOLKS. This was the message imparted to me by the cop, when he wouldn`t do anything about it !

Don`t worry. If you are a Viet Vet up HERE, you are AUTOMATICALLY a bad person ! You are AUTOMATICALLY "dangerous", and "unstable", although the facts in the matter are EXACTLY THE OPPOSITE. Yeh. Come on up to Maine, and watch the REAL "verterans day" celebration, that goes on for 364 days a year !

Actually, I think it was a company that advertised in CQ, not the
magazine itself. The same company advertises in pretty much all the
radio magazines.

The funny part of it is, the guy they're bitching about *is* a ham. He
posts his ham callsign, his registered monitor ID, his CB callsigns past
and present (or so I assume that's what the KSO-9650 is), and his
sideband numbers in his signature file. These jokers are just plain too
dumb to tell one from the other, I guess.

Yeah, that was them, CRB. I circled their number on one of those reader service cards in PopComm once, about three years ago, and I'm still getting stuff from them in the mail (CRB, not PopComm). They do sell some pretty interesting books and stuff though, that you can't seem to get anywhere else.

Isn't that, like, sacreligious or something? :-)

> different interests within radio for people to enjoy. As for the
> people who sounded off about my use of my monitor registry I.D.,
> well...I'm not going to waste bandwidth replying to people who
> criticize something that they obviously know nothing about. :-)

Hey, if they're that dumb that they can't tell a registered monitor ID from a ham call, why not point out how dumb they are? Maybe they'll be embarassed enough that next time they'll think twice before opening their mouths about something they don't know jack about.

I mean, three letters before the number...I'm not even a ham, and I'd know better than to waste my time looking in a ham callsign database for what is obviously not a ham call in the first place.

> KC2FNG, KNY2VS, KJK-14120, KSO-9650, AE279

Just out of curiosity...those are ham callsign, monitor registry, current CB call, old CB call, and sideband numbers, in that order...am I right?

You folks need to work on the other side of the counter before you cry a millon tears. Not everybody, as most of this news group thinks, are up to date with the latest buzz in electronics. You folks are allways badmouthing The Shack. Let's see you try to find a 22-mfd cap for only 99 cents and then have anybody mail it to you for free. You folks are allways complaining about the lesser smarts of the folks that work at the shack. Why don't you do somthing about it and ask the manager of your store if you can work part time on the weekends or nights. You will get a new understanding on the REAL world of retail. No retail electronic store can stock everything or know everything about all of electronics. DO YOU FOLKS KNOW EVERYTHING ABOUT ALL ELECTRONICS? I don't claim to know everything. Heck I can't spell half the time. BUT I TRY TO DO THE BEST THAT I CAN.

Feel free to reply to the anti spam address below.

ps-I'm sure that some SMART person will come back with a Long List of Smart things to say about my posting that will make them seem to be the BIG SMART GUY. So be it. Most people don't have the fogest idea of retail electronics.

Again if you are so smart in electronics then go to you local RadioShack
And ask the manager if she would like somebody to work part time on the weekends and nights. Untill you are on the otherside of the counter
then don't cry.

Thanks Brian , and thanks to you and your fellow firefighters in the LAFD and firefighters elsewhere. It is the Firefighters,Policeofficers and paramedics who along with our men and women in the military are the true heros of our country. Heros is a word used all too often these days. While I like sports What Football ,baseball , basketball and other professional men and women in sports do those NOT qualify them as heros, although some do lots of good off the field by their volunteer efforts and donations , I still don't think it qualifys as a Hero. Its is the Firefighter who crawls down a smoky hallway in zero visability searching for a victim, a police officer in an alley with a crazed gunmen with two strikes on him that are the real heros. While the LAPD has had its rash of unfortunate incidents recently, it seems only the negative gets reported by the press , all too often.I am sure 99% of the LAPD are top notch. I had a "taste" firefighting as a San Francisco Reserve for 11 years,but we rarely went into a burning building ,and the few times we did, the fire was 90% under control. I salute all our veterns as well as our Firefighters and Police Officers.

3178. Looking for Handheld with Dual Receive

Newsgroup: rec.radio.scanner
Date: 1999-11-10 00:00:00 UTC
From: gp@home.com
Message-ID: <MPG.1292a0ccba3050b8989684@news>
Source record: 102781
Cross-posted to: alt.radio.scanner,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.scanner

Hi...I'm looking for a handheld scanner or amateur radio that has wideband reception capability, and will let me listen to 2 frequencies at once. Specifically, I want to be able to simultaneously listen to 2 frequencies in the 160 Mhz railroad band.

I have an Icom 2SRA, which can do this, but requires 2 antennas. I would prefer a radio that uses only one antenna.

Some of the radios that I think might qualify are the Yaesu FT-51, ADI AT-600, Icom W32. I'm also aware of scanners that have "dual VFO", but I don't know if you can listen to both VFO frequencies at the same time.

Any advice would be appreciated.

Greg Pratt

From your postings, it appears you haven't used a PRO-92 or
don't understand what it does.

It can and does sequentially scan a mixture of conventional
and trunked systems. Further, the conventional channels can be
a mixture of channels programmed with PL, DPL, and carrier squelch
settings, e.g.,

Channel 00 = 460.525 MHz FM, 107.2 PL
Channel 01 = 460.575 MHz FM, DCS code <mumble>
Channel 02 = 155.475 MHz FM, carrier squelch
Channel 03 = 127.350 MHz AM
...

Source record: 102784

I bought a Pro 75 on a lark the first time they went on sale for $99, mainly to give my cherished Pro 43 a break. I agree with your comment on the good buttons. The main attraction for me was the exceptionally good audio -- rare in a handheld unit.

Other things I like:

- good battery life; again a surprise since strong audio tends to eat batteries,
- pre-programmed service scan,
- ok backlight,
- 200 channels
- surprisingly good performance in my rf-rich environment for a double conversion receiver.

Drawbacks:

- no 800 MHz coverage,
- search in only one direction (but scan either up or down - not so bad)

Great radio for 99 bucks. I haven't used it for demanding aero listening, but what I have done seems fine. Good luck!

I think you'll be better off just putting them all in,and it will become pretty obvious what freqs will be in use.The 150 scans fast enough that you won't miss much.There probably won't be more than 10 or so worth listening to in any one area,unless there's a wreck or some other disaster.The previous poster is right,the Amtrak freqs are only really used in stations and sometimes on the hand helds.(I hear them occasionally,but not often).You'd be amazed at what they say...

Your millage Wil vary!
That being said, there is very little above 1GHZ (1000MHZ) to interest
most people. There is the ATC transponders "Buzz" at 1040, there are
some hams up there, a few old point to point private telco system on
1.8, some TV STL or remotes but very little that you can do much more
than say, "yea there is some sort of singal." I can now monitor all the
way from 60KHz to 12GHz with no gaps. But there is very little up there.
3Gh Telco, 10.525Gh door openers, police traffic radar etc.
Unless you are a fanatic(it takes one to know one), there is not much
for the normal person to listen to above 1GHz. ITs your money, and it is
fun tracking down some of the TACAN sites (slow CW ID), and great sport
listening to microwave ovens (a bit higher than you are asking about
2.4G)_, I can ID most of them now by subtle differences in how they
sound, I suspect that the money could be better spent on almost anything
else. When I found out about SW then VHF/UHV I wanted to be able to
recieve "DC to light". I am not quite there, yet.

Hello everyone.... Im a caregivere for a quadrapelegic male in the northeast and my patient would like to get into this wonderful hobby of ours, the only problem is that he cant move any of his limbs and using a scanner un-attended is impossible. Does anyone know of any kind of computer software or scanner software that can make this happen? If anyone has any info on this matter please contact me at jj475171@aol.com, and thanks for reading my post, Take care.... Frank.

3200. BC100 XLT

How do I clear all the memory on the BC100 XLT. I understand there is a "reset" sequence.

Also, would the instruction manual for the BC120XLT apply to the 100XLT (other than the 120XLT-specific buttone such as "data"?)

And as another thought, a person who doesn't need their handheld to "do it all" might be well served. For instance, I could see where I might use my older 2042 to scan my conventional channels, and then use something like the Pro94 to scan the three trunked systems in my area. As it is I do this sometimes with just the conventional channels nearby - i.e., I might use the 2042 for local PD and fire, but use my 2005 for air. I.E., I divide up the load. Yeah, it can get a little weird trying to listen to two conversations at once, but, you get used to it :-)

Having said that, I personally don't want a Pro-94, but having all those channels might be more important than being able to scan everything with one scanner.

Hello,

I am looking for an old 4 ch. crystal controled Bearcat BC-12. The unit needs to be in good working order and receiving well. (I am not a tech person). Anyway, I am looking for this because it was the very first scanner I ever had. Please, if anyone has one in good condition for sale, please email me. Thanks a bunch.

There is very little voice traffic in that range. Mostly data. Also, you usually will need a gain antenna with good coax. I have several scanners that cover that range. There is nothing I consider worth monitoring up there. Get the better scanner independant of that upper coverage. And if they are the same, then get the less expensive one.

Well, actually...

I would have told the CC salesperson no way, and I WOULD have made an issue of it.

But to be totally honest, there ARE situations where there CAN be 'issues'.

One of which is here in New England. If I buy from a company in RI for example, and they don't charge me sales tax, they have to SHOW that it was delivered to MASS, not just 'picked up' in RI by a MASS resident.

Not a big deal, but NH, right next door, is TAX FREE. So what you ask? Well, under MASS law, ANYTHING I buy over a certain ammount is taxable. I believe the law puts a $500 minimum per item floor on it. If I buy a sofa for $3000 for example, I could legally be obligated to report it to MASS. Does that ever happen? NO! HOWEVER... The state of RI has been making noise the last two years, trying to get sales records from companies in MASS and CT that have delivered shipments to RI and not charged tax, so that THEY can collect it.

As far as I know, no other state in the area is even considering this, except for RI. (NYC I've heard has also been trying this somewhat sporadically, but ONLY for 'office equipment', or so I've heard.) So they COULD actually be obligated to get your name and address, but I find it hard to believe they would have a justification if you were 'picking it up' and paying cash, which implies you are paying the local sales tax anyway. NYC is a different case, as their tax rate is so high, you legally have to pay the 'difference' when things are brought in from out of the city.

If you must get one now, go for it. I hear thru the grapevine that they are on sale right now? Not sure on that, but if so then now is the time.

BUT

If you can wait up to 6 months from now, I'd bet dollars to donuts that Uniden will be releasing a mobile version of the TT2 within that timeframe. I think it will be called the 780XLT. Ought to be a great radio...

Of course if you're a true scanner fanatic like me, get them both! ;-)

For Sale: Motorola CP-1250 Alphanumeric Pager, with Warranty

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=197808105

For active people with too much to do and too little time, Motorola gives you a dependable and stylish big screen word message pager so you can get things done with ease. The Motorola CP1250 combines advanced "Big Screen" technology with a premium feature set. The CP1250 can display up to eight lines of text and up to 26 characters per line. It is so powerful that it can even receive and display graphics, such as logos, charts and graphs. The CP1250 supports Motorola's FLEXTM Information Services Protocol to receive and display large quantities of Information Service messages in an easy to read manner. The user-friendly Message Management features allow stored messages to be moved into one of five relevant folders, such as 'task list' and 'phone list'. The 8-line to 4-line zoom control serves to further enhance its overall ease of use.

Get a complete list of features from Motorola's Website at:
http://www.mot.com/MIMS/MSPG/Products/Alpha/CP1250/features.html

This pager is in excellent shape (10 out of 10 cosmetically) and is almost brand new. I've just been given a new phone through work and no longer need it. This pager is worth over $180! Reserve price is VERY reasonable... Please email with any questions. Good luck, and thanks for looking!

a person sent me this (thanks) so i thought i would pop it in here for all my radio buds incase you have not seen it !(binary graphics removed)

VBS/Bubbleboy Help Center

VBS/Bubbleboy is a new Internet worm, discovered 11/08/99. AVERT has assigned it a LOW risk assessment; it has not appeared in the wild.
VBS/Bubbleboy is a NEW type of worm: Unlike previous worms transmitted through email, this new type of worm does not come as an executable attachment. Instead, VBS/Bubbleboy infects PCs as soon as the transmitting email message is opened. This is a VERY significant innovation! In the past, it was not possible to contract a virus or worm merely by opening and reading an email message. This is no longer true, and VBS/Bubbleboy marks the beginning of a more dangerous computing environment.

VBS/Bubbleboy is transmitted through an email message with the subject heading "Bubbleboy is back!" It will ONLY infect PCs running Windows 98 with Internet Explorer 5 and Outlook or Outlook Express. PCs using Outlook are infected upon opening the email message, while Outlook Express users may be infected by viewing the message with Outlook Express's "Preview Pane" feature! When the email is opened, the worm creates a file called UPDATE.HTA. The next time the PC is booted up, the worm sends itself embedded in an email to EVERY address in EVERY MS Outlook address book on the local system. It does this only once.

a.. Get detailed info on how VBS/Bubbleboy works
b.. Scan now for instant detection and removal (requires McAfee Clinic subscription. Sign Up for a 14-day FREE trial subscription!)
c.. Get the EXTRA.DAT file (bubb-4.exe) for McAfee VirusScan 4.0.25 and above to add detection capability for VBS/Bubbleboy
d.. Download Microsoft's patch for Internet Explorer 5
Notes on detection, removal, and protection:
VirusScan Online (Scan Now and ActiveShield) has been updated to detect VBS/Bubbleboy.
VirusScan 4.0.25 and above require the EXTRA.DAT (bubb-4.exe) in order to detect VBS/Bubbleboy.
Microsoft has issued a patch for Internet Explorer 5 that will prevent the worm from executing under default security settings.
If the worm is detected before it has sent itself to your address book contacts, you should find and delete the file UPDATE.HTA. If the worm has already sent itself to your contacts, you should do nothing; the worm will not do anything further, and your PC is now effectively inoculated against re-infection. To protect your system against infection, disable Windows Scripting Host by following these steps: Click the Start button, Settings, Control Panel, then select Add/Remove Programs, then select the Windows Setup tab, then double-click Accessories, scroll down to Windows Scripting Host, and uncheck the box. Save changes and close the window.

a.. Purchase McAfee VirusScan 4.03
b.. Purchase the McAfee VirusScan Upgrade Maintenance Plan, and never get caught with an out-of-date version!
regards

>happens I would be thankful :)

A perfect hybrid balance between the subscriber loop and the central
office will only let one side of the conversation be heard, regardless
of frequency. Poor return loss will allow you to hear both sides.

3223. Bearcat 250 repairs

Newsgroup: rec.radio.scanner
Date: 1999-11-11 00:00:00 UTC
From: "Maher M. Hazine" <mhazine@primenet.com>
Message-ID: <80fj92dcr1@nnrp02.primenet.com>
Source record: 102626

Does anyone have any information on where I can get my Bearcat 250 Scanner repaired.

It seems to have the 989.200 frequency programmed on every channel and cannot be changed.

the odd thing I do think the scanner goes up to that frequency.

Thanks

I have a brand new, keypad programmable GP-68 VHF, 20 channel with
1200mAh battery and rapid charger / antenna. All original packaging and
instructions

Sell for $310 shipped

I have a Dish Network Model #2700 with SMARTCARD and remote for sale.
Card I believe to be invalid, best offer plus shipping

I have a NIB phoebe TV master Video capture card with all software,
box, manual and cables. TV/NTSC & S-Video inputs, DOES NOT require video

card loop to run. Follow below link to view complete specs
http://www.phoebemicro.com/multimedia/tvmaster/tv.htm
Asking $75 shipped

I have 2 UHF P110 motorola portables, both working with the following
exceptions:
1 has channel knob broken 1 Keys up when turned on, but it times out
OK,
Both receive OK, channel freqs unknown. Otherwise, 8/10 condition with
(2)batteries, (2)antennas and (1) standard charger. I
will take $300 for the pair

Pro-23, 50 channel 800Mhz scanner . Like new with box, manual, antenna
and batteries. Sell $100 shipped

Follow the link to view my other items for sale. If you have any
questions, e-mail me.

Anyone have any ideas?

3226. Cell Phone on Commecial Flight?

Newsgroup: rec.radio.scanner
Date: 1999-11-11 00:00:00 UTC
From: joepwalker1@webtv.net
Message-ID: <16973-382B5CEB-4@storefull-167.iap.bryant.webtv.net>
Source record: 102629

I know this subject has been beaten to death probably better than most topics that have appeared on here lately...but I did monitor an interesting conversation I thought I would pass on:

Yesterday, there was a Delta Airlines Flight bound for Austin, Texas who contacted their central dispatch via 129.550 mhz advising their dispatch with concerns regarding arriving in Austin on time and considering possibly re-routing the aircraft to San Antonio instead. Then whomever was speaking on board the aircraft (pilot, co-pilot?) advised their dispatch that "they just talked to Austin a few ago on the cell phone" to determine conditions.

Are they refering to a phone patch between the aircraft and the ground or the airphones that are on 450 mhz or 800 mhz or the everyday cellular phone? It really sounded like they were refering to a cellular phone in the cockpit.

Again, I'm not posting this to open up the old wounds of the last topic but I was curious of this....what type of communications to the flight crews use to make actual telephone calls with (phone patch? 450 or 800 skyphones? Cell Phones?)

Thanks

Joe KB5FAS

The cellphones you use on an aircraft (the ones on the cord in the seatback in front of you) run at the 960MHz range. My guess is that the pilot can use that same patch to call on what he called his cellphone. In that case they have designed the system not to interfere with the avionics.

Hello Everyone I am going to be building a scanner web page for new orleans due to the fact that the "new orleans scanner page" has been off-line for many months now (all most a year i think but im not sure) and i would like you to e-mail me any information you have about (a) Louisiana info. (b) gretaer new orleans info (jefferson,orleans,st. tammnay, Plaq parish) (3) national info also where is the best place to host the site (free hosting) becuase my personal home page limits me to 5,000 hit per a month also i am presently studying for a no code tech ham licence but i am aged student you can learn more about me by visiting my personal home page @ http://personal.msy.bellsouth.net/~mcinnisg/
also please send a cc: of your posting to my personal e-mail address due to school i dont allways get to check the newsgroup regularly also i would like info on free mailing lists advice for createing Mack's New Orleans Scanner Page etc. also i would like to meet people in the greater neworleans area who have simular intrests such as HAM radio, scanner radio ,etc.

reminder: send a cc: to mailto:mcinnisg@bellsouth.net due to the fact that school keeps me busy sometimes and i miss threads on the newsgroups thanks

again: mcinnisg@bellsouth.net

Cleveland had the same thing happen a few years ago. They are now all on an 800MHz trunked digital Motorola Astro system. Really sucks. However, news gathering organizations (TV, Radio, Papers) here can buy the radios without the transmit feature (or, maybe it's a special scanning version of it). They are not cheap (thousands) but are worth it for those who's business it is to gather and report the news. I guess the city approves the sale of such radios to the media here. Probably varies by city.

Still, we scannists are SOL regardless.

Go to www.universal-radio.com request their catalog or look at their catalog on-line. They have the best selection of Shortwave receivers. Also start picking up copies of Monitoring Times magazine or go to the publishers web site www.grove-ent.com. They also sell radio equipment. Also go to your local library at get recent, if possible, books on short wave listening. DO ALOT OF RESEARCH before you invest in any radios and buy what you can reasonably afford. There are lots of radios on the market that have different features. In addition look into possibly buying a used short wave radio. Most of the large radio/ham stores usually have a good supply of them. I am not well versed in satellite but Grove Enterprises (see above)is. Call or e-mail them. Feel free to e-mail me if you have any more specific questions.

Jerry_Fusilli@hotmail.com (Myself) wrote:

> Does anyone have a list of frequencies used by F1 teams in Europe ???
> (especially for Belgium Spa Francorchamps).

Unfortunately Formula 1 racing is the hardest racing sport to
eavesdrop. There are several reasons for this:

- teams don't have assigned frequencies, they have to apply for
temporary licences at every venue they go to and mix it up from race to
race
- teams consider information passed over the radios to be strategic
information and don't publicize frequencies lest other teams listen in
- other teams *do* sometimes listen in, so teams (esp. ones with deep
pockets) are beginning to use encryption
- searching for frequencies is a nightmare at the track because they
use the business band (UHF, though some are on VHF) which is swarming
with users at the track because of media, organizers, special events
crews etc
- when they warned you that your frequency counter wouldn't work well
in "noisy" radio environments, this is what they were talking about!
- sound quality coming from the cars is terrible and most drivers have
thick accents or don't use English over the radio (though drivers'
nationalities rarely have anything to do with team members'
nationalities so English is the common language)

I heard (for what it's worth - not much!) that some teams have been
known to use a frequency all through practice, qualifying and warmups
and then switch frequency when the race starts.

In light of all this, it is interesting to note a recent suggestion
that F1 would offer in-car radio to Digital TV subscribers as is the
case in many US autosports now. I can't see the teams agreeing to that
but you never know.

-A

The 94 doesn't cover any MilAir, You're thinking of the low 200's which is a ham band. If the PRO94 covered MilAir I would have bought it! :0)

Being a musician, in particular a band musician, I play concerts every July Fourth and Veteran's Day and it never fails that I am moved by all the veterans who attend in uniform ,surrounded by family and fellow vets. There is one piece of music that we play every year called "An Armed Forces Salute" which is a medley of all the anthems used by the various US military branches. The band director asks every year at these concerts for the vets to stand and be recognized when their anthem is played. And every year I sob as I try to play my clarinet, watching the veterans stand (or sit if they are wheelchair bound) while the audience applauds them over the strains of patriotic band music in the background. It is always a very emotional experience for everyone involved!

Rhonda:-)

I'm deciding whether to purchase a 1300Mhz max or 2000Mhz max scanner.

I'm curious as to the amount of traffic/activity between those freqs.

Is it worth the extra money in purchasing a scanner that can cover the
extra Mhz?

Thanks,

RH

I do not consider receiving Radio Shack's sales flyers "junk mail" in the slightest.

And there is no proof that Radio Shack sells or lends its mailing list to any other entity.

I have given my address to Radio Shacks throughout California and Arizona for over a quarter century. Not a single piece of mail from "junk mailers" can be attributed to Radio Shack's database.

And if anyone tells you otherwise - make them prove it. I believe that my 25+ years of history is a worthwhile point of reference on this issue.

Again, I must beg to differ. My BC245 only has 300 channels compared to the 1000 channels on the PRO-94. Depending upon whom you ask YOU may have just failed the IQ test yourself. That's not an absolute of course but it is all subjective.

Good description, but a few additions.

Continuous Tone Coded Squelch System, or tone squelch.

It can be useful to avoid intermod, general interference, although if
the interfering signal has audio that just by chance includes enough
noise in the tone frequency, you will still hear it.

It causes a slight delay in the squelch opening. i.e. you may cut
off the first part of a transmission. This is a tradeoff between
selectivity of the tone squelch circuitry and response time. The
narrower the frequency filter on the tone squelch, the longer it takes
to recognize a tone coded signal. At higher tone frequencies, the
squelch can operate faster, but the tone is more likely to be audible.

It's also used in repeater systems to select who will bring up the
repeater and/or reduce interference.

It's only a squelch system. i.e. it turns the audio on or off.
It won't make a signal clearer, except by muting the gaps between
transmissions. It doesn't allow two transmissions on the same
frequency at the same time.

Very interesting. The AGT (Air to Ground) RX spectrum is contiguous with
cellular radio, ie. the first TX channel is adjacent to 894 MHz. This is
why special cellular radio notch transmit filters are needed
at airports. These filters are typically the size of three scuba tanks.
Thanks for your post Jason, and happy flying.

With a high-quality radio, such as a Motorola Spectra or HT1000, the delay is not even noticeable. I use an HT1000 for UHF scanning from 450-512MHz, which a lot of agencies use around me, and it's very quick on the PL decode. For scanners though, I would say most _will_ give you a noticeable delay during scanning.

Also, if two or more users use the same frequency and you're right in the middle or closer to one Tx than another, if you're listening to the user further away the closer one will blow him out with his PL tone, thereby usually causing you're scanner to resume scanning. If one transmitter is more powerfull or closer to your receiver you'll have a hard time monitering the further station.

I have a brand new, keypad programmable GP-68 VHF, 20 channel with
1200mAh battery and rapid charger / antenna. All original packaging and
instructions

Sell for $310 shipped

I have a Dish Network Model #2700 with SMARTCARD and remote for sale.
Card I believe to be invalid, best offer plus shipping

I have a NIB phoebe TV master Video capture card with all software,
box, manual and cables. TV/NTSC & S-Video inputs, DOES NOT require video

card loop to run. Follow below link to view complete specs
http://www.phoebemicro.com/multimedia/tvmaster/tv.htm
Asking $75 shipped

I have 2 UHF P110 motorola portables, both working with the following
exceptions:
1 has channel knob broken 1 Keys up when turned on, but it times out
OK,
Both receive OK, channel freqs unknown. Otherwise, 8/10 condition with
(2)batteries, (2)antennas and (1) standard charger. I
will take $300 for the pair

Pro-23, 50 channel 800Mhz scanner . Like new with box, manual, antenna
and batteries. Sell $100 shipped

Follow the link to view my other items for sale. If you have any
questions, e-mail me.

http://www.bv.net/~mcguyver/forsale1.html

Icom IC-R7100 (Full 800 MHz) "MINT CONDITION"
+ Scanning Software

~ Low Use
~ Non-smoker
~ Mint Condition
~ Private Party Single Owner
~ Continuous Coverage - No Gaps!

Package includes the following:

IC-R7100 - Wide Band Scanning Receiver 25 to 2000 MHz.
Cellular - Covers the entire Cellular telephone band.
IC-R7100 - Instruction and Operating Manual.
Software - DeltaComm Scanning Software with Interface.
Shipping - Includes UPS Ground Shipping.
Receipts - HRO original Purchase Receipts included.
Boxes - All original factory packaging and boxes.

This rig is in factory new and in mint condition.
It is complete as listed above.

If you are seriously interested in purchasing
a top quality scanner, this is it. $1050
including ground UPS shipping in USA.

> such radios to the media here. Probably varies by city.

And I've read that at least in some locales the recieve-only versions of the radio are crippled to recieve only certain talkgroups. I try not to be paranoid, but that strategy may handily block out reporters who might overhear something inconvenient on a "sensitive" tac channel, and it keeps them dependent upon the police officials for their information. I'm personally uncomfortable with that arrangement.

> Still, we scannists are SOL regardless.

Yep. At least until someone creates a consumer digital scanner and runs the legal gamut to bring it to market. It'll happen eventually, and I think it'll bring a lot of these concerns out into the open. But I don't think it'll be easy.

Source record: 102508

The CTCSS tones are also known as PL (Private Line) or CG (Channel
Guard) tones,
brand-names of RCA and GE respectively, I believe.

"Tone squelch" is generally (sipposed to be) sub-audible;
if properly adjusted, you can 't hear them in the audio,
but the receiver can filter them and open the squelch of the receiver.

The frequencies of the analog tones in use in many commercial services
and in amateur radio (All in Hz):
67.0, 69.3, 71.9, 74.4, 77.0, 79.7, 82.5, 85.4, 88.5,
91.5, 94.8, 97.4, 100.0, 103.5, 107.2, 110.9, 114.8, 118.8,
123.0, 127.3, 131.8 (used on at least one interagency channel in NJ),
136.5, 141.3 (PL 4A - very common), 146.2, 151.4, 156.7, 159.8,
162.2, 165.5, 167.9, 171.3, 173.8, 177.3, 179.9, 183.5, 186.2,
189.9, 192.8, 196.6, 199.5, 203.5, 206.5, 210.7, 218.1, 225.7,
229.1, 233.6, 241.8, 250.3, 254.1

They are also known by alphanumeric combinations (e.g., 4A) but I
can't find that list right now.
There is also a newer 'digital' tone squelch system that uses tones in
between these.

Note that if both transmitters are keyed at the same time, the RF can
still
beat and cause interference, but generally speaking you can block
unwanted transmissions by 'turning on the PL' being transmitted by the
the station
you *do* want to hear so the properly coded receiver's squelch will
open.

Stan
****

Ralph Mowery wrote in message <382C9335.4CB732EA@dialpoint.net>...
|You will not be able to receive anything more with the ctcss. This
ia
|made to keep from receiving too much. It is an audio tone of a low
|frequency that is placed on the transmitter audio. There are about
15
|to 20 standard tones that range from about 80 to 250 Hz. They are
low
|enough in frequency that they can be filtered out in the receiver.
Most
|comercial receivers only pass audio from about 300 to 3000 hz. That
is

|plenty for normal speach.
|
|One example of the ctcss is a local fire dispatcher is wanting to
|communicate with several volunteer fire departments. If each
|transmitter of the volunteers are assigned a specific tone for each
of
|the departmenats they will only hear the communications for their
|units. That way one transmitter can be used for several receivers
with
|out others having to hear the communications.
|
|You probably do not want to spend the money for the ctcss unit unless
|you only want to hear specific transmissions from a transmitter known
to
|be using it.

Indeed, batteries will get warm. Just how hot do they get though? If they're almost hot enough to fry an egg on, then I think you'd better be worried. But, if they are just at the line of really warm/hot then I wouldn't worry about it. Case in point: my cellphone battery pack gets very warm when charging. It's NiMH. When I charge my RadShack NiMH's they do get very warm. I was bothered by this @ first but now I'm used to it.

3290. Help with inoperative BC100XLT...

Newsgroup: rec.radio.scanner
Date: 1999-11-12 00:00:00 UTC
From: Gregory T Miller <gtmiller@acsu.buffalo.edu>
Message-ID: <80ilr3nrf1@prometheus.acsu.buffalo.edu>
Source record: 102515

Hi,
After a month of not using it, I tried listening to my BC100XLT today
and realized it wasn't coming on. I plugged it in to the charger, nothing
(the chrage light was on). I checked the battery voltage and it was right.
Then I tried turning it on and off repeatedly while listening to the speaker
(usually you can hear a pop even if the batt is dead), nothing. Now, I've
got the unit open trying to find a pcb fuse or something else that's fried.
Any suggestions? I'm not squeamish with this stuff, and I've got experience
with these little boards. Any hints/ideas would be appreciated!

Thanks,
- Greg

3291. FA: PRO-34 Scanner

Newsgroup: rec.radio.scanner
Date: 1999-11-12 00:00:00 UTC

Message-ID: <382CDD66.7D34037B@globe-net.net>
Source record: 102516

For those interested, I'm selling a PRO-34 scanner. It has been modified for the expanded frequency range, it has a 6.144 MHz crystal instead of the stock 2 MHz one for much faster scan rates, and includes a new set of nicads and charger. For more info, follow the link or contact me directly:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=199544259

Thanks,

Robert

I have been looking all over for a wireless headphone set, maybe you guys can help me out?

What I need to have is a unit like the 900 Mhz wireless headphones I see in the stores. The only thing that I need different is that I don't want the receiver actually in the bulky set of headphones. Instead I would like to have a small belt unit that will act as the receiver and that I can plug any set of headphones, or earbuds into.

I plan on using this in a shop type of environment where a big bulky headset will not be "ok". That's why I'd like to go with a smaller set of my own headphones. I also need to move around the shop a lot so I'd like to go with a wireless set (not infrared though). Does anyone know if such a unit is made? I found one that would be great, it is used in the recording industry as a studio monitor, but the $1100 price tag is about 11 X more than what I'm looking to spend.

I also found a perfect sized FM radio that I can wear on my ear. Can anyone tell me what kind of range I can expect if I use one of those "bugs" that lets you broadcast your own radio signal in the FM band? I'd really not need more than about 200 feet of range with this unit. I'm thinking that I could just "borrow" un unused freq. and use this tiny FM radio to pick it up.

My ultimate goal here is to build a wireless MP3 server for where I work. It is a rather large shop and a radio does not work well. Also a large set of headphones will not work well as I'd really like to hear my surrounding environment while I play the music. I have most of the parts I need for the server, and this wireless part is the most crucial one remaining. If anyone could offer some thoughts on how I can broadcast my signal trough the shop and keep it rather static free for a few hundred feet I'd appreciate it!

> > resin that covers a part of one of the boards. Does anyone know
exactly
> > what this resin is made of?

It's a scratch off game piece material. Scratch it off and see what you won.

OK seriously. Does it matter what it's made out of? No. All I know is that it is there to keep people from modding their scanners for cell coverage. FerChristSakes leave it alone!!!!!!

Follow me on this one. Joe ScannerGuy manages to peel off this "stuff" and unblocks his unit. He then tells all his buddies on usenet what he did. Soon enough someone puts up a website. Some other not-so-smart reporter or kid or whatever reads the website, does the mod, blackmails a senator or something stupid and gets caught. Then the FCC catches wind of this, imposing still tighter restrictions on scanner manufacturers, thereby making scanners more difficult to manufacture and more expensive to buy. In the process this nutcase puts all of us in a bad light and then another HR514 somes sailing into congress. Do you really need full coverage that badly? No you don't.

The whole reason we have blocked scanners in the first place is because everyone who got a cell capable scanner back in the good ole' days shouted the fact from the rooftops, instead of keeping their mouth shut and quietly enjoying the fun.

So to answer your question, that black goo is made up of our own stupidity, wrought from the farthest reaches of our own big fat mouths.

3297. **FOR SALE** MVT-9000M3/DO-9000

Newsgroup: rec.radio.scanner
Date: 1999-11-12 00:00:00 UTC
From: rayjr@earthlink.net
Message-ID: <80g35g$ur1$1@nnrp1.deja.com>
Source record: 102544

Hello:
I am selling my MVT-9000M3/DO-9000. I purchased this scanner on July-6-1999. The MVT was my first scanner. I thought this was a hobby I would enjoy and have time for. I really don't have the time now and I don't find it as enjoyable as I thought I might. Here is a list of items I am including in the total sale.

Let me say the MVT is in perfect condition. Not really used that much at all. I have the orginal papers from Bandercom, INC.

1-MVT-9000M3/DO-9000 with the rubber duckie
2-Diamond RH77CA Antenna
3-Don't remember the name of the other antenna. Will describe. Stainless steel and extends out as much as 4'5"
4-Ear Plug
5-Clip
6-Hand Strap
7-Police Call book by Radio Shack 1999 edition

Price $350. Not a penny less :)) I think this is a very reasonable price to be paid by Cash, Certified check or Money Order.

I live in Montgomery County, Maryland and of course anyone who would like to get togother to see above items I would be more then glad to do so. It would be best if your interested to respond to my email,

rayjr@earthlink.net

or my cell phone 301-442-3012

Thank you and I want to thank all of those who helped me with my decision as to what scanner to by, ie, Rick Wells and Mika at Bandercom.

If you have a C-band satellite receiver (you know, the ones connected to the big 6 to 12 foot dishes), you can hook the scanner up to the LNB output and monitor Single Channel Per Carrier satellite radio stations with your scanner if it covers up to 2000 MHz. These transmissions fall between 1050 MHz and 1500 MHz.

I am looking for some opinions on this descrambler. How good is it?
How difficult is it to build (I quite capable of using a soldering iron,
and I had repaired a number of CB's in the past)? Lastly, is there a
better choice out there?

It seems to me that the CTP is the best one available. based on
different things I've run across on the net.

Thanks,
FeMaster

3307. Looking for Handheld with Dual Receive

Newsgroup: rec.radio.scanner
Date: 1999-11-12 00:00:00 UTC
From: gp@home.com
Message-ID: <MPG.12931cd99386753f989687@news>
Source record: 102554

Hi...I'm looking for a handheld scanner or amateur radio that has wideband reception capability, and will let me listen to 2 frequencies at once. Specifically, I want to be able to simultaneously listen to 2 frequencies in the 160 Mhz railroad band.

I have an Icom 2SRA, which can do this, but requires 2 antennas. I would prefer a radio that uses only one antenna.

Some of the radios that I think might qualify are the Yaesu FT-51, ADI AT-600, Icom W32. I'm also aware of scanners that have "dual VFO", but I don't know if you can listen to both VFO frequencies at the same time.

Any advice would be appreciated.

Like so many things "it depends"....
The old ENG (electronic news gathering) toys had striaght AM for the Video and FM for the Audio. The newer ones have variuos digital modes. Try the 1.6 to 2.0G range. I will try to find my logs form the past and post the actual freqs I logged them on. You have to be very near the ENG van or in (or near) the path, like in an apartment bewteen (or just off a line between) the van an the station. A local church has (or had) a dedicated STL that ran all the time and was convinient for checking my gear.
By striaght I am reffering to standard NTSC bradcast video.vistigial sideband etc.
And "singal" should have been "signal"..one of these days I just might learn to spell and type!

Jerry_Fusilli@hotmail.com (Myself) wrote:

> Does anyone have a list of frequencies used by F1 teams in Europe ???
> (especially for Belgium Spa Francorchamps).

Jerry,

If you try my website at www.raceradio.freeserve.co.uk you might find it
of some use in finding the freqs used
by the F1 teams. (Drop me an email if you want any specific questions
answered).

I can echo pretty much everything Alasdair said though.....

>Unfortunately Formula 1 racing is the hardest racing sport to
>eavesdrop. There are several reasons for this:

Correct!

>- teams don't have assigned frequencies, they have to apply for
>temporary licences at every venue they go to and mix it up from race to
>race

Correct, although the constraints of the radio equipment the teams use
mean
that they usually stick to within 2 or 3MHz of a designated freq.

>- teams consider information passed over the radios to be strategic
>information and don't publicize frequencies lest other teams listen in

Correct too!

>- other teams *do* sometimes listen in, so teams (esp. ones with deep
>pockets) are beginning to use encryption

At a British Touring Car Race, I have actually listened to one team
member
relaying information about a rival team, based on their radio
transmissions.
I have also seen BTCC team members with scanners and radios. If it
happens in BTCC,
then I'm sure it happens in F1. Re the encryption, the number of teams
that use encryption
has actually dropped from 4 in 1995, to 2 this year (Ferrari and
McLaren). I would expect more
teams to move to digital radios (TETRA and the like) before they spend
loads of money on analogue encryption.

>- searching for frequencies is a nightmare at the track because they
>use the business band (UHF, though some are on VHF) which is swarming
>with users at the track because of media, organizers, special events
>crews etc
>- when they warned you that your frequency counter wouldn't work well
>in "noisy" radio environments, this is what they were talking about!

Correct, and add to that the problems of actually trying to hear your
scanner with 22 racing cars going past
at 150mph. It REALLY is a nightmare. Noisy all round.

>- sound quality coming from the cars is terrible and most drivers have
>thick accents or don't use English over the radio (though drivers'
>nationalities rarely have anything to do with team members'
>nationalities so English is the common language)

I actually didn't have much of a problem with this. Try the .wav files
on the audio page on the website
to judge for yourself.

>I heard (for what it's worth - not much!) that some teams have been
>known to use a frequency all through practice, qualifying and warmups
>and then switch frequency when the race starts.

Last year for the British GP, Mclaren used the same freqs for testing,
qualifying and then switched them for the
race warm up and race itself. Prost, Minardi and Sauber did the same.

>In light of all this, it is interesting to note a recent suggestion
>that F1 would offer in-car radio to Digital TV subscribers as is the
>case in many US autosports now. I can't see the teams agreeing to that
>but you never know.

I think Bernie 'do as i say, or else' Ecclestone might 'convince' them
to agreeing to this.
After all, it's another value-add dimension to Digital TV that Bernie
will want to flog to us.

To receive meteosat or inmarsat will require high gain antenna aimed at the
birds. ATV is (unless you are really into generally poor quality both
technical and content) not going to interest most folks. There is also the
GPS signals, but those require special receivers.
I still supect that for most people, the world above 1GHz is going to be a
waste. Line of sight will require you to be in the path of very directional
antenna. Line losses will eat up what ever signals you do intercept.

As the police chief of Philly says: no one needs know our business
in summation.

Gee.

Is this not where the Liberty Bell resides.
Is this not where all those famous papers were signed?
is this not the birthplace of our democracy?
Is this not the place where an open government is a good government?

I wonder what the police chief got in High School in History?
Sounds like
he's a high school graduate.

...and then asking the citizens to pay for their being unable to
know

only in cuba, vietnam, china, USA.

this puts us in great company.

There is a Unix dvp decoder.....however from what I have learned it
will be realesed in early 99....if all goes well...Only thing I know
is the standard Keys are used...written by a Motorola Tech....

Astro.c is the file name

cc astro.c -o astro

Worked on my Linux system...with my local PD...so well in fact....they
have now abandon all DVP..... : -)

I guess ebay doesn't like us to sell our scanners on their auctions, I still have this for sale to the highest bidder.

It is in the original box with manual, new rechargable batteries and charger in very good condition, it receives cellular. Send me you bid if interested, Thanks, Jim

sorry about the ebay bids!!!

I have a BC-9000 that I have had for several years. I am getting ready to retire and am going to have more time to enjoy scanning. This radio has a place for a CTCSS module. My question is this, what is CTCSS and what would I have the possibility to recieve that I don't get now? The manual doesn't explain what it is, just how to install it. Thanks for the help.

Jim Auguston

Jim,

I forget exactly what the acronym means, but it basically allows you to cut interference by only opening the squelch for a transmission that has the right sub audible tone.

For example:

Let's say you have 462.5000 programmed into your scanner.

Joe's Construction and Sally's catering both share that same frequency, but use different CTCSS tones:

Joes Construction: 162.2hz
Sally's Catering: 173.8hz

On a normal scanner, you would hear them both. No way to lock out one and still receive the other.

But with the CTCSS capability, you can listen to Sally's by setting the tone on that channel to 162.2hz. Joe's will not come thru.

I find it useful for eliminating interference. My 895 is a very sensitive unit, and sometimes pager noise and other junk gets in there and overloads the unit. But with CTCSS on, since the interference doesn't have that tone, I don't receive the noise - just the good stuff.

As neat as I think it is, unless you have a need like my example, where you only want to hear one agency on a frequency that many others share, or you have interference problems, you probably don't need to worry about it. CTCSS means you hear less, not more.

Hope that explained it.

-Phil

You got it. They do a lot of video productions for internal use and also run learning programs to members.

As far as it being encrypted, I have never heard the actual things myself; which may explain my current state.

You need to check the production date code on your bc700a to see if it is modifiable. This scanner was, apparently, produced before and, again, after Congress passed a law that scanning receivers in the US could not "listen" to cell frequencies. As a result, some of these scanners can be opened up to receive the entire 800mhz band and others cannot. Check the Scan Shack web site (sorry, don't know the exact address) for further info.

There is a special cellular radio service designed exclusively for aircraft. It isn't the same as the cell phone most folks use on the ground. I suspect that's what the pilots were using.

It's also possible they were using Iridium or Inmarsat.

Naw. It's probably just a terrestrial microwave link. These things
typically have DS3 or higher rate signals on them. If you get more
detail on the license, you'll probably discover that it includes a
beam width and direction as well as a very low power (like something
under a watt of power).

If you happen to be inside that beam, you could set up a dish of your
own and attempt to intercept these signals. But that takes some
serious equipment...

A CTCSS module does the opposite... it allows you NOT to hear some things! Lets say your local city had only one frequency of: 155.010, and they use it for police, fire, and the garbage truck. You only want to listen to police, and fire. Using the CTCSS option, you can allow the police and fire to get through, while blocking the garbage truck.

Any service using CTCSS, can be monitored without the CTCSS module installed.

You will not be able to receive anything more with the ctcss. This ia made to keep from receiving too much. It is an audio tone of a low frequency that is placed on the transmitter audio. There are about 15 to 20 standard tones that range from about 80 to 250 Hz. They are low enough in frequency that they can be filtered out in the receiver. Most comercial receivers only pass audio from about 300 to 3000 hz. That is plenty for normal speach.

One example of the ctcss is a local fire dispatcher is wanting to communicate with several volunteer fire departments. If each transmitter of the volunteers are assigned a specific tone for each of the departmenats they will only hear the communications for their units. That way one transmitter can be used for several receivers with out others having to hear the communications.

You probably do not want to spend the money for the ctcss unit unless you only want to hear specific transmissions from a transmitter known to be using it.

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

800 MHz Air to Ground Telephone [22.1107]

- - Airborne - -
Blk Ch 1 - Ch 29

10 894.0055 - 894.1735
9 894.2055 - 894.3735
8 894.4055 - 894.5735 Guard Band -
7 894.6055 - 894.7735 .x765-.x797
6 894.8055 - 894.9735
5 895.0055 - 895.1735 Control Channels -
4 895.2055 - 895.3735 .x813-.x973
3 895.4055 - 895.5735
2 895.6055 - 895.7735
1 895.8055 - 895.9735

Transmissions are AM (or AM/SSB), and converting to digital.
Channels are spaced 6 kHz apart. A specific block of 29 channels
is assigned to each geographical area. Ground frequencies are 45
MHz lower and do not echo the airborne half of the conversation.
Service is used on passenger airlines.

> They are also known by alphanumeric combinations (e.g., 4A) but I
> can't find that list right now.

The posted list included a number of frequencies (69.3, 159.8, 165.5, 171.3, 177.3, 183.5, 189.9, 196.6 and 199.5 Hz) that are not part of the EIA, Motorola or ICOMM standards. I would appreciate it if someone could verify them and identify the relevant standard.

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

CTCSS (PL) Frequencies

Freq (Hz)	Designator EIA	Ham	Freq (Hz)	Designator EIA	Ham	Freq (Hz)	Designator EIA	Ham
67.0	L1	01	110.9	2Z	15	179.9	6B	29
71.9	L2	02	114.8	2A	16	186.2	7Z	30
74.4	WA	03	118.8	2B	17	192.8	7A	31
77.0	L3	04	123.0	3Z	18	203.5	M1	32
79.7	SP	05	127.3	3A	19	206.5	8Z	
82.5	L4	06	131.8	3B	20	210.7	M2	33
85.4	YA	07	136.5	4Z	21	218.1	M3	34
88.5	L4A	08	141.3	4A	22	225.7	M4	35
91.5	ZZ	09	146.2	4B	23	229.1	9Z	
94.8	L5	10	151.4	5Z	24	233.6	M5	36
97.4	ZB	11	156.7	5A	25	241.8	M6	37
100.0	1Z	12	162.2	5B	26	250.3	M7	38
103.5	1A	13	167.9	6Z	27	254.1	OZ	
107.2	1B	14	173.8	6A	28			

Motorola differs from EIA with: XZ (L1), XA (L2), XB (L3), YZ (L4), YB (L4A), ZA (L5). ICOMM does not use 97.4 and uses one less than the amateur numbers above that (i.e. ICOM #25 = 162.2).

WHo is your ALS provider, MONOC or Robert Wood Johnson? Monoc Medics from Freehold are usually capable of using your town's BLS. (At least that's the way it works in Freehold.) MONOC's Call sign for They're Freehold unit is 5954 or medic 4. I have the freq. for the Robert Wood Medics, but I got to find it.

Tony is on the money with 155.175. I have heard MONOC Medics on that Freq. That's Monmouth County EMS 1 I hear multiple Squads on that but I'm not sure but I thought Old Bridge's BLS was on the trunk system. In that case look for MONOC units on "MED 9" which 462.9500 I hope this helps.

You're probably right, Bill. I have a few freq guides from 1-2 years ago so
my info might not be current. Thanks for your further info though.

Regards,
Tony

> As the police chief of Philly says: no one needs know our business

Philadelphia does not have a "Police Chief", they have a Police
Commissioner and several Deputy Commissioners.

If you listened to the whole comment, he was commenting on an incident
where New York City Police Officers were "set-up" by a group of
individuals using scanners. Final tally, two officers killed, several
injured.

> Is this not the place where an open government is a good government?

The "birthplace" of Democracy is a dump, that is why citizens and
businesses are leaving the city in droves!
The "famous papers" were drafted by thieves and criminal outcasts from
England. That is probably why Philadelphia is such a popular cesspool
for that type.
>
> I wonder what the police chief got in High School in History?
> Sounds like
> he's a high school graduate.

If you are talking about the Police Commissioner, he has a Masters
Degree in Criminal Justice and another Masters Degree in Business
Administration. Besides being one of the highest decorated police
officers in the New York City Police Department before coming to
Philadelphia, during his first week here he single handily apprehended a
"Most Wanted" strongarm robbery suspect by himself in Rittenhouse Square
after the creep robbed and assaulted an elderly female. When offered a
Medal of Valor for that incident, he told the Mayor to present it to the
two patrol officers who responded to the call initially, he stated,
"They are the guys who deserve it most!"

Seems many PD's are going to this method.

And some PD's are very justified in thier reasons....IE : Detective Div..etc...

However routine traffic is NOT a catagory to use DVP or any form of Digital , only Trunking ...

Be hold scanner users....

Digital has *MANY* downsides....

The signal is horrible...seems to be very low end..Bass like...almost muffeld.

The signal is very bad indoors...

If your PD is using UHF & DVP..I wish em the best..,

Keep in mind most of these new posts we see about such n such city is now Digital..

This stuff was bought over 5 yrs ago in some cases....Ive even documented a case where a Trunk system was bought 15 yrs ago....and it took em that long to implament said trunk.

They never used DVP.

Our local PD used dvp for 4 yrs...now sadly (Snicker ...Laffing)

Thier dvp unit is mucked up.....with no $$$ to upgrade....thier SOL....

If you can belive this..

Here is a town, that has a population of 8,000 ppl..of those 38 % are over 55 yrs of age!

They used a vhf system of a frq of 142.9650 MHz...using old Motorola Radios / Portables.

They did get new portables (Saber III) ...However if the batt runs out...which is VERY common...they MUST return the HT because the KEY will be lost ...and re programming will be needed !

The mobiles are the SAME units as yerter-year...however with a Spectra W9 intreface...a - crude - attempt at dvp...but it worked...for 4 yrs..

Officers we know were quoted as saying " I hope we dont use digital anymore , we cant hear anything "

Nice PD huh...

In the end , and when you add up the brass tax...any and all Digital systems are like computers...PIII on sale...999.99 !

Then you walk in the next day.... PIII Blowout 699..00

That is the downside of Digital....UPGRADE....thats how Motorola made its BILLIONS over the last few yrs...!

So its $$$...can degrade the signal....pissess off the users who cant yet decode a simple form of DVP (DES-XL) is diff...

That stuff anyone can buy...its not Militart grade....off the shelf at the local 2 way store !

The systems always need Upgrading from new keys...to re entery of the old ones..to cars that loose power..also loose the ' Key '

Now our PD has one DVP system for sale....cuz in the end..it was simply too $$ to maintain...

Hope that gives you some hope...

here are the standard tones for ctcss,
67.0, 71.9, 74.4, 77.0, 79.7, 82.5, 85.4, 88.5, 91.5,
94.8, 97.4, 100.0, 103.5, 107.2, 110.9, 114.8, 118.8, 123.0,
127.3, 131.8, 136.5, 141.3, 146.2, 151.4, 156.7, 162.2,
167.9, 173.8, 179.9, 186.2, 192.8, 203.5, 210.7, 218.1, 225.7,
233.6, 241.8, 250.3 Hz.
all other ctcss tones, are and are not standard, motorola has a few of their
own ctcss tones. and other comercial radios.
as said above, is true. the best use for ctcss is in a high interference
area, or if you are transmitting yourself. but since the ctcss board was not
built in the scanner, they can get expensive for the board, and not really
worth it.

>Overall value vs. cost?

Like I said in a previous response, they are very different radios.
Only you can properly assign "value" to each radio. However, with
regards to 2), the 8200 audio output is not all that great.

You ought to go download the manuals for the two radios and spend some
time reading them. Look at all the extra stuff the 8200 does and see
if those features are important to you. The 8200 manual is at
http://www.aoruk.com/pdf/ar82001.pdf,
http://www.aoruk.com/pdf/ar82002.pdf, and
http://www.aoruk.com/pdf/ar82003.pdf.

You'll have to ask about where the Pro-92 manual is at (I can't
remember right now).

3372. Winradio 1500, internal or external ??

Newsgroup: rec.radio.scanner
Date: 1999-11-13 00:00:00 UTC
From: cmos@shol.com
Message-ID: <382dcbb5.11828178@news.shol.com>
Source record: 102419

Hello,
I am thinking about buying a winradio 1500.
But I am not sure if I want the internal card, or the external box.
One of the biggest uses I have for it would be useing it as
a spectrum anilizer.
Yes, I know it is not the best in the HF range, but that is not
were I plan to spend most of my time.
If there is no differents between the internal and external, I would
like to get the internal.

Ok, now for my questions.
Taking into acount I have good grounding and coax connection to an
outside anntenna, which one would have more computer noise ?

Along those same lines, what one would have better sensitivity ?

Besause one oh my biggest uses would be as a spectrum anilizer,
I would like a compleat coverage from 150khz to 1.5ghz with
no cell block. But I live in the US, can I buy one from Canada
with no cell block, and have it shiped to the US ?

Can the winradio be modified to remove the cell block easly ?

In geteral, given what I want to use it for, should I go internal or
external ?

Thanks for any help.

Looking for a way to keep track of all of those frequencies you have discovered?

SCANNER is the answer. The program features:
* Import and Export ASCII files
* Printed reports by Service, Departmen, or Frequency
* Ability to sort by any field (or fields)
* Ability to select by an field (or fields)

Take a look at the scanner homepage located at:

http://http://www.comnetcom.net/~guido//scanner/scanner.htm

and check out the screen shots.

Only $20.00 brings this fantastic program to your doorstep. Send check for disk or send check with e-mail address and I can send the program to you as an attachment.

I would recommend the external unit. It doesn't require a slot in your system, doesn't generate additional heat, or put a burden on your systems power supply. Can easily be moved to different systems! Looks good too!

3375. RadioShack's Trunked Frequency/Talk Group Guide JUNK?!?!

Newsgroup: rec.radio.scanner
Date: 1999-11-13 00:00:00 UTC
From: av8tor@flash.net
Message-ID: <lblX3.266$16.40789@news.flash.net>
Source record: 102422

I just bought a RadioShack PRO-94 Scanner, this is my first trunking scanner. I have been able to listen to the Reading, PA Polic/Fire trunk system on non-trunking scanners as it's a Motorola type II system that's easy to receive, but soon I'll be moving to Florida where theres a lot more trunk activity.

Well, so far I like the scanner (except for its lacking MilAir and the below standard speaker).

But the book "National Public Safety Trunked System Frequency & Talk Group Guide" SUCKS by my first impression.

I've listened to Reading's trunk system before, I know the frequencies. However this "guide" lists 6 frequencies and NON are correct!!!!!!!!! The only thing they got correct are the Fire and Police talkgroups.

Anyone else have experience with this "Guide" RadioShack includes with their trunking scanners? Should I not even bother with what they list for Florida?

George

The list is indeed from an amateur grouping. It's out of an Alinco DR610TQ manual. You are correct that in the several systems used there are variations.

George:

You can find very current information in the web! Here's a couple for starters:

http://electricrates.com/trforum/trboard.htm
http://www.trunktracker.com/

I bought a PRO-94 and also returned it because it sucked.
does the PRO-92 have better audio?
The manual says the PRO-94 had 350mW audio output.
Either that is a lie or they use the world's crappiest speaker.

Message-ID: <382DF5E6.FAFF4CA2@webtel.net.au>
Source record: 102429

Firstly Phil, maybe you should look at the email adress of the original sender. Me.
Fortunately for us here in Australia, we live in a truly free country, unlike the USA, which only claims to be a free country, but yet restricts the listening of the cellular band, in fear that maybe a corrupt polititition that is running the supposed free country known as the USA willget caught saying something he isn't suppose to. Personally I think its good that people listen in and these so called leaders of the free world get caught doing the wrong thing. Someone has to keep them in line. It just goes to show how corrupt they must be if they have to pass laws to stop peoplelistening to them on the cellular band. If they had any sense, they would do what is happening here. Upgrade the technology to GSM, so that no one can hear.
Personally I am not interested in unblocking the cellular band. I couldn't think of anything more boring to listen to then joe blow talking to his friends on his mobile phone. Even if I did I wouldn't be breaking any laws in Australia anyway. I have several receivers here that do it anyway.
The reason I am interested in removing the black resin is to see if it is possible to unblock the other bands that can be unblocked in some Undien scanners, such as the 78Mhz to 88Mhz band.
Please spare me the lecture on the unblocking the cellular band. I don't need it.

Dave

3383. Uniden 245 scanner

Newsgroup: rec.radio.scanner
Date: 1999-11-13 00:00:00 UTC
From: Ted Fairhurst <tfairhur@interlog.com>
Message-ID: <382E01DF.948183C7@interlog.com>
Source record: 102430

The recently arrived Uniden 245 hand-held scanner is capable of monitorint trucked radio systems based on what I believe is the Edaac system. To my knowledge, this is the first scanner capable of following the radio traffic of the Toronto Ambulance Service. The question is: does anyone know how soon Uniden might be marketing a desk-top model of this scanner?

Ted Fairhurst, Toronto.

3384. F.T.PRO-2022 scanner,full 800 Mhz

Hi there,
I would like to trade my good condition PRO-2022 200 channel base unit scanner,It has full 800 Mhz in good condition and it works great!
Idealy I would like to trade for a Pro-26 or Pro-91 or Pro-67, Pro-2045,or Pro-43, Pro-39 or ????? If I have I have to throw a few $$$ in as well thats fine
The radio must be in good to excellent condition as well please.
Thanks

Icom R-2 with an antenna adapter and a length of flexible wire in your shirt pocket, using a small ear bud in your ear for a speaker. You can't do better than the R-2! In fact I should be getting another one in the next week which is only about a week or two old which I will be selling. I currently use one all the time. Take care. Wayne.

Actually, the FCC just approved an experiment use of cellular on aircraft
using some relatively unique technology. Can't recall the detail but it can
be found on the FCC web page in the report and order section of wireless
telecomm bureau.

69,26 "Radio Modern"
69,80 "Europa Plus"
70,19 "Radio Nostalgee"
71,30 "M-Radio"
72,14 "Orfey"
72,92 "Radio Retro"
73,40 "Radio 7 - on the Seven Hills"
73,82 "Echo Moskvy" (Moscow Echo)

Generic FM stereo encoding

90,60 "Autoradio"
91,00 "Echo Moskvy" (Moscow Echo)
92,80 Moscow City Government Propaganda Radio
100,10 "Silver Rain"
100,50 "Radio Nostalgee"
101,20 "Radio 101"
101,70 "Radio NSN" (National News Service)
102,10 "Radio Classica"
102,50 "Open Radio"
103,00 "Radio Rocks"
103,70 "Radio Maximum"
104,20 "Nadezhda"
104,70 "Radio 7 - on the Seven Hills"
105,20 "Business Wave"
105,70 "Russian Radio"
106,20 "Europa Plus"
106,80 Changed

107,40 "Hit FM"
107,80 "Police Wave Radio", "Slavyanka Radio"

1.2. AM & LW public broadcasts (medium & long wave)

kHz Station Name

549 "Mayak"(Becon)
612 Religious
693 "Deutsche Welle" (German/Russian Language)
738 "Radio Orfey"
792 "Rakurs"
810 "Medicare for You"
846 "Radio Company "Moskva", Radio "Radonezh" (Rel.)
873 "Radio Rossii" (Russia Radio)
918 "Open Radio"
963 "Krishnaloka"(Rel.)
1044 "Radio Libery" (Russian Language) NEW !!!!!!!
1071 Changed
1116 "Christian Public Channel"(Russian, Rel.)
1152 "Radio Orfey"
1206 "Echo Moskvy'
1233 Armenian Radio
1260 BBC World Service (Engl.) / BBC Russian Service (Russ.) - shared schedule
1305 Radio 1, "Police Wave Radio"
1359 "Svobodnaya Rossiya"
1413 "Camerton Radio"
1440 ?Radio France International? (Fr)
1467 "Golos Rossii"(Voice of Russia)
1485 "Centr Radio"

1.3. Public TV (MHz) (SECAM D/K)

Chanel Video Sound Station

1 49.75 56.25 ORT
3 77.25 83.75 TV Centre
6 175.25 181.75 TV-6 Moscow
8 191.25 197.75 NTV
11 215.25 221.75 RTR
23 487.25 493.75 TRK "Delta" (City of Dolgoprudniy)
24 495.25 501.75 CNN (English Lang.)
27 519.25 525.75 CTC-8
31 551.25 557.75 "32-st Channel"
33 567.25 573.75 Culture Channel
35 583.25 589.75 Technical feed
49 695.25 701.75 RenTV
51 711.25 717.75 MuzTV

3. Cellular & Trunk communications

3.1. "Bee-Line" cellular (AMPS, DAMPS)

825-845 mHz - mobile units (handsets)
870-890 mHz - cell transmitters
NFM, every 30 kHz for AMPS; for D-AMPS - several channels per carrier)

3.2. "Moscow Cellular" (NMT-450)

453-457.5 mHz - mobile units
463-467.5 mHz - cell transmitters
NFM, every 25 kHz

3.3. "Mobile TeleSystems" MTS/"Bee-Line GSM" (GSM-900)

890-915 mHz - mobile units
935-965 mHz - cell transmitters
digital, multiple channeling per carrier

3.4. "Mobile TeleSystems" MTS/"Bee-Line GSM" (GSM-1800)

I have one Icom IC-R100 Communications Receiver for sale. This is a Scanner plus a Shortwave Radio. Its in good condition. Owned by non-smoker.

Wideband frequency coverage 0.5 - 1800 MHz continously with FM, AM and Wide FM modes.
100 Memory channels, 20 Programmable scan edge channels and 1 priority scan channel.
Multiple scan functions including auto memory write scan.
24-hour clock system with muliple timer functions.
A variety of tuning steps corresponding to any operating band. 1k, 5k, 8k, 9k, 10k, 12.5k, 20k, 25k.
800 MHz band NOT Blocked.

Comes with: Mounting bracket, CP-11 (optional) 12volt cigarette lighter cable with noise filter plug, original operator manual.

Asking $550.00

I don't have the model number in hand, but has anyone had any problems with the little (roughly $25) Maha charger that charges either 4 AA or 4AAA cells (either NiMH or NiCad)?

Mine gets the batteries REALLY warm (uncomfortable to hold after a few seconds) most of the time. And every other charge or so, it seems that it fails to charge two of the cells (it's a dual-circuit charger).

The folks at Maha have said that it's normal and OK for the batteries to get so hot, at least during the first 5 or so charge-discharge cycles...

What experiences and/or knowledge does anyone have to share?

Thanks,

Radio Shack Pro-2032 200 channel base or mobile scanner. This model covers 30-50, 108-136, 137-74, 380-512, 806-960. It is cell blocked but can be restored if you are good with a soldering iron and wire cutters. Date code is 2A4. It has jacks for ext speaker and 12v operation and has hyperscan. Item in good physical and perfect working order. I would like $125 or trade for ???.

I've got two Maha chargers such as you describe. I use them to recharge NiMH batteries. The inexpensive MH-124S is a slow charger. During the lengthy charge cycle, the batteries will get pretty warm, and will stay warm as long as they're left in the charger. I didn't like this, so I bought a MH-C204F fast charger. During the fast charging period, the batteries will get hotter than they do in the slow charger, but once they are charged, the charger cuts back and the batteries will cool off to only slightly warm. I'm very satisfied with this charger.

I'm looking into getting a trunking scanner. Reading a few comments about the Pro-92 gave me a few ideas of what I want in the scanner. I don't know what others there are out there so I'm requesting some help here.
Here's a few things I definitely want it to have:
(A) Must be able to scan trunked systems and conventional @ once.
(B) Must be able to have group lists, as the Pro-92 does not have this ability.
(C) Must be able to do all the systems the Pro-92 can do.
(D) Have PL & DPL ability.

All the other features, like alphanumirics, etc., isn't a high priority though I assume I'll want them later on. The unit does not have to be portable. Thanks for any and all help, folks.

Regards,
Tony

It's not the food orders that most people want to listen to. In various Fast Restaurants employees have a switch on their headsets which allow them to communicate with each other internally. This is accomplished with various CTCSS PL tones. You would really be suprised at what you can hear sometimes! (rude comments about the customer, etc)

The following article on monitoring Fast Food Drive Thrus appeared in the August 1996 edition of Monitoring Times:

==========

FAST FOOD SMORGASBORD
By Bob Grove

"Welcome to McDonald's. May I take your order?" How many thousands of times every day is this friendly greeting parroted across the Country? And how many scanner enthusiasts tune in 154.600 and 35.02 MHz as they drive past interchanges on our nation's highway system?

But the big arches are not the only architecture to house friendly fast-food frequencies. Just about every chain with a drive-by kiosk has two-way intercommunications with its customers, using frequencies in low band, high band, UHF, and even 900 MHz.

While the belt-worn transceivers are low power, the fixed repeater can usually be heard for a half mile or more. A local McDonald's restaurant uses a Panasonic system known as the "Order Taker," a likely name, indeed. A nearby Hardees' system is made by H.M Electronics. While the radios are usually sub-audibly tone encoded to avoid interference (see Table 4); some cases of intentional interference have led to substantial fines and suspension of FCC licenses when hams have abused their radio privileges.

Some unintentional interferences have proved amusing. A church reportedly installed a wireless public address system on the same frequency as an adjoining fast-food restaurant. As the minister raised his eyes skyward and requested divine guidance, his parishioners heard the electronic reply: "Cheeseburger, all the way, hold the mayo!"

Clerks frequently switch to internal intercom without realizing that, while the customers can't hear their comments, stalwart scanning enthusiasts can. Common fare includes discussions of dates, working conditions, other employees and their employers, and remarks about customers. When the scanner listener happens to be the customer, he reaps a particular delight in catching the employee off guard by responding to what was suposedly a private remark.

A short time ago we learned of one resourceful and highly unlawful prank pulled by a ham with a crossband-capable transceiver. Poised between two prominent fastfood restaurants, he tuned in the customer frequencies from one restaurant and retransmitted it to the competitive restaurants' order takers. Wendy's order takers were understandably miffed when they were getting orders for Big Macs, while McDonald's clerks were scratching their heads figuring out how to serve up a Frosty! It may seem like harmless fun, but don't do it!

This month MT takes a look at the vast, largely unrecognized spectrum shared by these harbingers of hamburgers. We owe a special debt of gratitude to Bob Eisner for sharing the largest and most-up-to-date list of fast food frequencies ever published.

>I've been monitoring 42.5 from New Hampshire all morning. I-80 area,
>maybe midwest or CA.

In the Kansas City area, I have been listening to New England skip
since about midnight Saturday night.

Medical comms on 33.64, fire department boat rescue on Cape Cod
(secant?) on 33.52, ambulance call on 33.74.

I don't know what "secant" could mean. It was a report of a fisherman
who was reported to be in difficulty. The caller said he could no
longer see the fisherman. I listened to this one for about half an
hour and could hear the mobiles as well. Another call was for a
gasoline spill of about 15 gallons at a McDonald's.

The reason I checked at all was because I read on a mailing list where
someone had heard Deutsche Welle on 30.82. Well, that is a second
harmonic of 15.410 MHz. I couldn't hear that, but I heard Spanish
two-way.

The odd thing is, I couldn't hear skip anywhere else but 33.50 to
35.00 MHz. I tried other ranges. Of course, I was using a simple
setup -- a PRO-51 and a cheap set of rabbit ears which I was manually
rotating.

I wonder how soon though. Our local police (Durham Region, Ontario, Canada) just went totally digital today. They really promoted the reason was so that people with scanners couldn't listen to them, and if somebody ever could, they could go to encryption very quickly. As to "no laws", the philosophy is that the airwaves are public property. If you want to use them and expect privacy, then you, the user, must make the signals private. It is illegal here for an unintended recipient to decrypt encrypted signals, or to tell a third party what you heard in any transmission that wasn't a broadcast. So, a personal conversation (cell, whatever) isn't private, but if you encrypt it, then you are explicitly making it private, and the law recognizes that. I have overly simplified things, but that's the gist. And I'd love to see how a spread spectrum scanner does its thing.

I'm considering getting an IC-R10.
Are all of them Cell Modifiable with the 2 10K resistors?
I can't stand the idea of spending lots of money on a continuous coverage radio
without it not having 100% continuous coverage.
It's just the principle that makes me sick, as cell phones are boring as crap compared to
listening
to your neighbor's cordless phones. ;)

A freind of mine recently gave me an older Realistic Pro 2011 scanner.She knows it works,but she recently lost her codes.I am an idiot and cannot figure out how to program this thing.If anyone can help instruct me, I would surely appreciate it.
Problem 1:
Most frequencies I find are in a 6 digit format,with the last three seperated from the first by a decimal point.This scanner only allows for entering 5 digits,with the last two seperated from the first three.How do I adapt to this?

Problem 2:
What does squelch do and how do I make use of it?

Problem 3:
Does it matter what 'channel' I program for which frequency?

If any of you smart folks can help me, feel free to post here or E-mail me.

I would venture to guess that BLS switches fromt he Old Bridge
trunked system to JEMS 1 (155.220MHz/103.5Hz for Middlesex County,
155.175MHz/151.4Hz for Monmouth County) to talk directly with whichever
ALS unit they are receiving. Old Bridge may do as East Brunswick has,
and keep an old conventional repeater in use only for incoming ALS. In
this case, I'd try the old police repeater on 460.375MHz (CTCSS may have
been 146.2). I haven't had any hits on this channel in quite a while,
but I may simply be out of range of it.
As an aside, the East Brunswick channel that has remained in use is
453.375MHz/156.7Hz (repeater); all I've heard on it is MedRescue 2
(formerly Medic 622) talking to EB dispatch.
Other, potentially useful frequencies for RWJUH/SPMC ALS:
'Operations' (F-5) Repeater: 155.325MHz/D0051. 'Citywide' (F-6):
155.355MHz/69.3Hz (simplex). A CTCSS tone of 186.2Hz is used on the
standard med channels. All units are paged on Middlesex County JEMS 1.
Other units dispatched by 'MedCentral' are 681&682 (Somerset
County/SMC), Mercy 6, Mercy 7, Mercy 9, Perth Amboy MIC (all serving
other areas of Middlesex County & environs). Forgive me if I have left
any out.

Radio Shack Pro-2032 200 channel base or mobile scanner. This model covers 30-50, 108-136, 137-74, 380-512, 806-960. It is cell blocked but can be restored if you are good with a soldering iron and wire cutters. Date code is 2A4. It has jacks for ext speaker and 12v operation and has hyperscan. Has 10 20-channel memory banks and a 10-channel bank for storing search findings. Scan delay, Priority Channel and Individual Channel Lockout. Item in good physical and perfect working order. I would like $125 or trade for ???.

To see some pictures of the scanner go to the following:

I bought my first scanner in 1991.....after I took an early retirement
option. I discovered cellular phones by accident. And, damn, I wish I
had been able to hear this stuff years earlier. I learnt more about
human nature in the next few years than I had learnt in a lifetime of
working and living with the facades that people erect. Cheating
spouses, thieving business partners, lying politicians.....heard them
all on the cellphones. And lots more on the cop channels.
Mostly,I was not interested in personalities.....just human nature
hiding behind supposed invisibility.
Yeah, suppose I am a sick person.......wouldn't be posting here if I
wasn't :)

There is only ONE THING that would get a city to switch back from digital, and that's a public outcry not only loud, from a wide range, not just scanner users (whip up 'Secret Police in the US of A?' feelings), AND for those angry citizens to REFUSE to aid the police in any way, refuse to TALK to police officers more than legally required, and in short, ostracize them. It ain't gonna happen.

Of course, campaining _successfully_ to get all elected officials who voted for it out of office at the next election couldn't hurt, either.

I got a 10% off coupon just yesterday (11/12) in the mail with my new RS credit card. Actually, I've had a card of theirs for years, but this new one is a combination credit card/ATM card. RS credited me $21.20 (incl tax), so the Pro94 is a really good deal now! :-)

The Pro92 won't be going on sale for quite a long time, per a highly-placed source at Tandy. The Pro94 is RS's Xmas blockbuster deal.

Niskayuna EF Johnson LTR Frequencies: 857-860.9875.

One of the three frequencies is a "conventional" frequency for PD (855.9625),
and then the three together can be used as a trunked system.

Let me know if this info is any good, OK ???

Mike

Once again you are wrong, they haven't taken away the right for the people to have guns. I you want a gun, you go and apply for a licence, and if you are not a criminal, or insane you will get a licence and be able to go buy a gun. The system just restricts criminals from getting in the system and getting guns. I suppose its alot better then letti8ng some fruitcake get a gun and walk into the local primary school and blow away young children, like they do in the country of the free- America

There is a relatively new system of cellular phone system available to aircraft, it was released about two years ago and is called Aircell. It operates on standard cellular frequencies with upward facing antennae. A great deal of testing was done to prove there would be no interference with the regular cellphone system.

Go to www.aircell.com.au

Source record: 102464

I have a Pro 2039 forsale. Its a 200 Channel AM/FM Direct entry
programmable scanner. It is in excellent condition. I am the only owner
and a nonsmoker. I just dont use it as much as I use to, its a great
bargain to you. It comes with its own telescoping antenna, has a "BNC"
antenna connect on the back, and is AC only. (desktop model not a handheld)
It is about 3 years old. I will ship it to your door for $130 CONUS. I have
the original box and manual. It would make a nice gift.

From: Will Marchant <kc6rol@amsat.org>
Message-ID: <382EC61B.5D9730BE@amsat.org>
Source record: 102466

Hi rec.radio.scanner readers:
I'm hoping for some help utilizing the tape recorder control lines on my AR-3000A. I'd like to be able to read this status on a BASIC Stamp I/O port. The manual says that the two pins are remote switch contacts. Since there is never a voltage across these, I assumed I could put 5V onto one and read the other one from the I/O port. No luck (even switching polarity.) Anyone have some suggested schematics or sage advice for utilizing this capability? Thanks!

I need to make room on my radio table and would like to trade my Radio Shack Pro 2036, base scanner. The Pro 2036 has 200 channels and covers the Milair band. This unit also has the CTCSS tone board installed. Offer includes AC adapter, manual, and antenna. Unit is in excellent condition. This unit has a date code of 4A4, so 800 mHz mod is possible.

Would like to trade for 200 channel hand held scanner.

Thanks,

D. Schopp

Edison has begun replacing its antiquated Johnsons ("be-de-boo-beep!")
with digital squaking devices of some kind. I'll venture to say that
if they do switch to trunking out of their own (my) pocket, they'll go
GE like South Brunswick. If Middlesex County is involved in financing,
as they were with the police cars, they will certainly go Motorola.

Stan

I *have* tracked "junk mail" to RS by spelling my name incorrectly or (not) using my initial, so they don't get my N/A/P, especially for cash sales. I've also bought things under several names...

I've been Alexander Hamilton, and showed them a Federal Reserve "photo-id" to prove it.

I've also been "Paid Cash". (The "Sales Associate" had started the slip before he realized he wasn't getting good info on that one, so we had some fun with my address. I wonder if the mail ever got to the house number three blocks into the Hudson River.)

And for the supremely clueless and annoying (one of which I got fired, thank God), I'm "Noy F. Business"

I understand they switched over to a new Motorola Astro _digital_ trunked system just this past week. Unfortunately for scannists (and for citizens and reporters in the city who like to know what's going on around them) such digital systems cannot currently be scanned. Sorry, I have no further details. I didn't even see anything about the switchover until after the fact.

Here's a story from the CityPaper that you might find interesting. It's primarily about the similar system in Philidelphia, but it also mentions Baltimore.
http://www.citypaper.net/articles/062499/feat.coverstory.shtml

FWIW, Balimore County, which is politically and administratively completely indepenent of the city, is still using their analog Motorola trunked system, which can be scanned. I doubt that they have any intention of switching to a digital system anytime soon. At least I sincerely hope not - Balitimore County is right next door to where I live in Carroll County, and anything serious almost inevitably spills over.

From: Steve <Steve@HalloweenNet.com>
Message-ID: <382EEE45.4BDDFC11@HalloweenNet.com>
Source record: 102479

My understanding is that my local county system in San Diego is half digital half analog voice modulation. I'm told that my scanner will follow the trunking of the digital but it is not understandable. I also understand that the communication is not encrypted. Has anyone tried sending audio out from a scanner into the digital input of a soundcard? Could it be as simple as an D/A converter?

These are just some thoughts for other to explore.

Steve

Source record: 102483

A local TV station (FOX2, here in Michigan), has a "Fame or Shame" feature, in which they tested the claims of the new 2.4 GHz cordless telephones. I'm not positive if it was a Uniden they tested... I'm thinking it was a Panasonic. Bottom line was, it ended up in the TV2 Hall of Shame. In real-life testing, it's range was not much more than the 900 MHz type phone, and it also produced images on lower frequencies that were "in the clear".

3483. Data Slicer Issues (Help!)

Newsgroup: rec.radio.scanner
Date: 1999-11-14 00:00:00 UTC
From: Steve <Steve@HalloweenNet.com>
Message-ID: <382EF12B.1B330433@HalloweenNet.com>
Source record: 102484

I've built a simple data slicer per some internet plans. I've used the slicer.exe to check it's operation. It doesn't work right off the bat, I have to hit the (R)everse command to get data. Once that is done it works fine.

ALL of the programs I'm trying to use with it are not respondeing to this device. Some of the programs have a Reverse command but I'm not sure if that refers to the same reverse of voltages between CTS and RTS that slicer does. Do I need to reverse some wiring of my slicer device?

Trouble shooting that I've done:

Checked output from Discriminator output - OK
Check comport addresses and set up - Com 2 2F8 IRQ 3

Please let me know if you have any suggestions. This circuit is the "Quick and Dirty Data Interface"

Thank You,

Steve

This is true... there are some BIG disadvantages to having a digital system. It takes more equipment (i.e. more radio sites) because digital communications requires a good signal to work or nothing gets through. This makes a digital system far more expensive than an analog system. Here in San Diego the Sheriff's department went to an APCO-25 system and the helicopter had to stay below a certain speed or the doppler effect created a timing problem and the radio didn't work.

Joe, I was listening to Art Bell and he told all the listeners that cell phones do work in airplanes. I think he was in a small private plane, but I am not sure. All I know is that he was suprised it worked cause he figured that major airlines prevent it cause they don't work. I think the reason for the ban on commercial is that it may interfer with something else. Hope this helps, ryan

PS: You are a ham radio operatior? I am just now getting into ham. The reason is cause I have a CB and was wanting to replace it with one of those new cobra nighwatch radios. A co-worker said that I should get a ham radio cause the distance is much further. I am taking the test this Dec. (Tech. no-code) and hopefully will pass one or the other. The question I have is where is info on ham freqs. I have found skywarn freqs, but are there certain freqs set aside for travel (kinda like channel 19 and 9 on CB?) thanks, ryan

Bill check this site out as it may be the Panasonic you were referring to. The problem with the Panasonic reviewed in the website below is that the base to handset is spread spectrum 2.4 gigs, but the handset to the base is good old FM 900 mhz, read not secure at all.

http://community.etown.com/news/articles/panagiga022399ska.html

Cheers Karl

Thanks Karl... you're right, it is the Panasonic, and that was the problem!
Thanks for clearing that up!

That being said, I also would be interested in hearing about the pro's, and
con's of the Uniden 2.4G phones!

Those of you who have ENTERGY as your power company, I have the list of 800 mhz frequencies - at least a hundred of them. So far, I've been unable to make any sense or see any pattern from monitoring their transmissions. It does not appear to be a trunked system, at least not in the way I am used to trunking systems. Does anyone have any ideas on Entergy's frequency layout?

Thanks in advance.

Have you looked at the Yaesu VR-500? It has wider coverage than you
specified, 100 kHz to 1.3 GHz. It can be programmed from a PC,
though I don't think it can be *operated* from a PC. There are 1000
channel memories, with 8-character alpha labels. And it receives
AM, FM (narrow and wide), SSB (USB/LSB), and CW.

Dave

PL, stands for Private Line, a Motorola name for CTCSS

CTCSS stands for Continuous Tone Coded Squelch System. It's a system
in which a subaudible tone is broadcast along with the voice carrier,
which opens up the receivers squelch. This receiver can be a handheld
radio operating on simplex, or a repeater's squelch or CTCSS equipped
scanner.

It's a system used typically when multiple organizations want to share
the same frequency within the same area.

There are standard tones, but there are also non-standard tones in use.

These are the 38 standard CTCSS tones used by Motorola systems:

Tone 01 67.0 Hz Tone 20 131.8 Hz
Tone 02 71.9 Hz Tone 21 136.5 Hz
Tone 03 74.4 Hz Tone 22 141.3 Hz
Tone 04 77.0 Hz Tone 23 146.2 Hz
Tone 05 79.7 Hz Tone 24 151.4 Hz
Tone 06 82.5 Hz Tone 25 156.7 Hz
Tone 07 85.4 Hz Tone 26 162.2 Hz
Tone 08 88.5 Hz Tone 27 167.9 Hz
Tone 09 91.5 Hz Tone 28 173.8 Hz
Tone 10 94.8 Hz Tone 29 179.9 Hz
Tone 11 97.4 Hz Tone 30 186.2 Hz
Tone 12 100.0 Hz Tone 31 192.8 Hz
Tone 13 103.5 Hz Tone 32 203.5 Hz
Tone 14 107.2 Hz Tone 33 210.7 Hz
Tone 15 110.9 Hz Tone 34 218.1 Hz
Tone 16 114.8 Hz Tone 35 225.7 Hz
Tone 17 118.8 Hz Tone 36 233.6 Hz
Tone 18 123.0 Hz Tone 37 241.8 Hz
Tone 19 127.3 Hz Tone 38 250.3 Hz

3502. (Q)Hand Scanner to AM Radio Antenna in car

Newsgroup: rec.radio.scanner
Date: 1999-11-15 00:00:00 UTC
From: sheldonsmith@my-deja.com
Message-ID: <80pe5l$9bq$1@nnrp1.deja.com>
Source record: 102300

Radio Shack sold a device ($19.95) that allowed for connecting ones hand scanner to the AM car radio antenna. The device looked essentially like a splitter with a typical car radio antenna on one leg (input into the car radio), a BNC connector on another leg (to the hand scanner), and a jack for the extrenal radio antenna.

Apparently, Radio Shack is out of stock of these items.

Is there anything out of the ordinary with this device that one cannot make a similar device by splicing a Hand Scanner input into the AM car radio antenna? Any issues regarding scanner performance when conencting it to an AM radio antenna?

Thanks in advance for any insights,

Sheldon

Interesting question - I don't know myself... However, I was looking at the RS discone Saturday and the description said "stainless steel" rods (as opposed to someone else said they were hollow aluminum?). I'll go back and check the threads today if I get a chance. Bottom line is I'd hate to pay an extra $30 to $40 for the _exact_ same thing from Diamond...

Source record: 102305

Hi, Peggy,

Welcome to scanning! By all means, try to get a replacement for the owners manual, but I'll try to answer your three questions.

1. At worst, your scanner would be off frequency by 5 KHz, which would cause most scanners no problem at all. But, most scanners are pre-programmed to know the standard frequency spacing of channels within each communication band, and to make good guesses at the 5KHz level. For example, channels in the VHF aviation band have 25 Khz spacing and channels in the VHF business band have 15 Khz spacing. So, if you enter 123.45 in the aviation band the scanner knows that you really mean 123.4500 Mhz. But if you enter 153.45 in the business band, it knows that you really mean 153.4550 MHz.

2. The squelch control sets the minimum signal strength at which you want the scanner to stop and play a frequency in use. For any signal below that level the audio is "squelched", and the scanner passes by that frequency without stopping. In the "wide open" position the scanner will stop on all frequencies, perhaps playing only a hissing sound (often mistakenly called "squelch noise" -- it's really "unsquelch noise"). At the opposite extreme, in the "tightest" squelch position, only the strongest signals cause the scanner to stop and play. Choosing a setting for the squelch control is a very subjective matter. You want it to be "open" enough to hear weaker signals, but to be "tight" enough not to stop where there's nothing worth listening to. Usually I open the squelch until there's a hiss, then turn it back a until the hiss stops, and then turn it back a little more. Sometimes, though there is interference on one of the frequencies I'm scanning, so it's useful to "tighten" the squelch more to avoid stopping on the interference. This allows stronger signals to play, but might lose some weak ones.

3. Usually it's strictly a matter of preference which frequencies you program into which memories. Most scanners organize channels into banks which can be selected or de-selected for scanning. With my listening patterns I organize a 100-channel mobile scanner by location (at home, at work, and in-transit) and by service (police / fire / EMS; aviation / traffic; other ;-) and then select only the bands of interest whereever I happen to be at the moment. Rarely, such as with the Pro-2036, there is actually an advantage in scanning speed gained by programming the channels by increasing frequency.

Have fun, and come back often!

I bought a 200xlt used and it has worked fine for a few years, however the rechargable battery just died. Inside the pack were 6 ni-cad batteries. Can I just replace those? Or can I use akaline aa batteries and just keep switching those out?

Also before, i could use the ac adaptor going through the battery pack to listen at home, but now the batteries are dead, i cannot. Is there any way to be able to use the adaptor without the batteries at home?

Thanks

Mike

I think you have a different problem. As I remember it that scanner only goes to about 512 MHz!!

Actually the truth is that there are more then just the "HELLO I WANT A COKE" Freq! There is a freq that talks ONLY amongst the employees and NOT out to the board! Back in my teenage days I worked McD's and all my friends would were headsets at night and the talk had nothing to do w/ work!
Like for instances the customer talks to the employee and he can sit there and rip the customer apart amonst the employees w/o the customer hearing! "Listen to this FAT SLOB ordering" "come on Bit** I don't have all day is it a coke or orange drink"? "Hey Mike this guy is Rude spit on his burger for me" YES THE COOK weres a Headset TOO! we did this amongst ourselfs all day in order to stay sane at that slave shop.
If 1 or 2 of the customers heard what we said about them they would have probally kicked my *** !
Have fun
me

Too drunk to place an order? Sorry but that is not probable cause to initiate a traffic stop for DUI. And if in fact the cops in your town are doing this (highly unlikely), then there is a huge story waiting to break, and numerous lawyers chomping at the bit to make some money. Who's to say that a person with a speech impediment isn't attempting to order? Or that the passenger in a vehicle is placing the order.

3515. FS: Radio Shack Pro-2032 Programmable Scanner (Trades Considered)

Newsgroup: rec.radio.scanner

Radio Shack Pro-2032 200 channel base or mobile scanner. This model covers 30-50, 108-136, 137-74, 380-512, 806-960. It is cell blocked but can be restored if you are good with a soldering iron and wire cutters. Date code is 2A4. It has jacks for ext speaker and 12v operation and has hyperscan. Has 10 20-channel memory banks and a 10-channel bank for storing search findings. Scan delay, Priority Channel and Individual Channel Lockout. Item in good physical and perfect working order. I would like $125 or trade for ???.

To see some pictures of the scanner go to the following:

>Also before, i could use the ac adaptor going through the battery pack to >listen at home, but now the batteries are dead, i cannot. Is there any way >to be able to use the adaptor without the batteries at home?

Yes. Open the pack (two Phillips screws) and disconnect the leads that go to the batteries. Tape the + (red) lead down so it does not come into contact with the - (black) lead. Then connect your AC adaptor to the recepticle. External power will now go directly through the radio instead of taking the usual route through the batteries.

Bob Grove sells a similar item for $16.95. www.grove-ent.com. Catalog number CPL 63B.

Do they work? Dunno. Never used one. But like all splitters, it devides the available incoming signal between two receivers. therefore, you will have less signal at both the scanner and the car radio vs either one being connected directly to the antenna.

What I would really like to see here is a SWITCHER that delivers the full signal to either the scanner OR the car radio. Anyone know if such an animal exists?

If there is any interest in such a project I may decide to program
it. In something such as this, dBase III-Plus compiled by Clipper
might be the best fastest way to go. COBOL takes a very long
time to code, but it's ability to hold huge amounts of data might
also be a good idea.

I'll think it over for a time. I'm retired now so it's not like I have a
problem with time {Smile}.

A short but dumb question! After I wrote and debugged such
a system, where would the best place be to upload the ZIP
files so people could download it?

Pretty amazing you had a BC250 last this long. Mine died years (5-6?)
ago and I
was never able to find anyone to fix it. Uniden said 'no' and so
did every place else I tried. Finally sold it
to someone for parts.
Sure do miss that radio, though.
Good Luck with yours!

More details please? It could be several things, such as ARS HT's
or FRS radios. You must take a test and pass in order to talk on amateur
radio frequencies. FRS is free and requires no license.

But if the circuit is a diplexer as opposed to a 3 dB splitter, the losses will be minimal assuming that it is well built, and there is enough guardband between the commercial broadcast frequencies and the scanner frequencies.

Has anyone heard any rumors about new handheld scanners in the market that will have: (It seems like "someone" should come out with all these features in one radio)

1) Continuous coverage (25MHz to 1.3 GHz approx.)
2) PC interface

3) At least 200 channels

4) Alpha tag

It seems like "someone" should come out with all these features in ONE radio!

Thanks...Brian

ScanStar Deluxe will do all three major US trunking formats (LTR, Moto,
EDACS) as well as conventional mode, and at the same time. While other
programs (like E-Trax, TrunkTrac and Probe excel at their individual modes
obviously they will only work one at a time.

With my OptoCom I use:

E-Trax for pure EDACS following
TrunkTrac for pure Motorola trunk following
Probe for pure conventional monitoring
ScanStar when I want to do some of each.

Hello Everyone...

Please take a moment to look at the PRO-2042, 1000 channel scanner with
Optoelectronics OS 535 computer control add-on, software, manuals ...
this is a total package.

Follow this link to the Auction

Thank you for your time,
David Honeycutt

Sometimes you do HAVE to!

If you choose to pay by check!
If you want something delivered!
If you buy a service like a cell phone, satellite TV, or Long Distance service that has a contractual aspect.

... and every store is required to display a signed statement by the CEO confirming that names and addresses are never disclosed outside the business. You can be certain that any similarity between a miss-spelled name in the RS computer and a mailing received from someone other than RS is an unfortunate coincidence. It is RS policy that disclosure of customer (or other data) outside the business results in an end to employment. CEO Len Roberts gives his assurance - and he IS a man to be believed. Look at Tandy Corporation stock prices - the revenue earned from selling customer names is not even worth the effort, by comparison with the plans Len Roberts has for the business. Customer information does not leave the organization and its sub contractors.

>I'm very satisfied with this charger.

Thanks, yes, I have the C204F. I thought there was some concern about
heat buildup in NiMH when charging them with conventional chargers. As
hot as the C204F gets them, maybe this concern isn't that big a deal?

I'm still convinced there is something wrong with the charger
though... Does yours ever fail to charge up both pairs of cells? This
happens regularly on mine. Very annoying. Usually if I just wait a few
hours and put them same cells back in the same slots in the charger,
the cells charge OK the 2nd time. This doesn't inspire much
confidence.

|-->> When will Bill be back to teach us all about scanners?
|-->>
|-->
|--> He teaches all about databases now:

I reached the ripe old age of 50 this past September. During my working career I worked as a senior programmer/analyst as well as software engineer.

Be that as it may, whenever I need a database I use dBase III Plus.

If it is an entire software software system, I use Micro Focus COBOL. I use MF COBOL because of its speed and ability to maintain files until you literally run out of disk space. All these new and improved database systems take up far, far too much hard drive space and are especially hoggish in terms of memory management. I finally bit the bullit by increasing my memory to 128 Megs. Combine that memory with a 6-plus gig drive and I can do almost anything I want to do.

Anyway, just wanted to briefly jump into the discussion here and let others know that these new, huge systems aren't the "Hot Shit" systems they are suppose to be.

Anyway, thanks for getting the grey matter moving again. Retirement will do that to you if you don't watch out. Shoot! I may just decide to make some calls tomorrow and see if there isn't some small programming job that needs to be done out here in Atlanta.

Off and on I've been working on an entire software system using Micro Focus COBOL to track all parts of keeping records on at least one vehicle, and will track the maintence of an entire fleet of vehicles. I'll finally start the software coding effective tomorrow morning. It will take a long time to do, but the cost is good: I'm not going to charge anything for the software. I have decided to finish up a personal software system to track all phases of automobile use. Maintenance, gasoline, and everything else so when I turn it in for trade all I have to do is print off the maintenance schedule and costs. Whenever my project is finished, I'll just probably stick it out there for free and let others use the software for six months or so and send me recommendations on improvements.

I had an idea to program a master frequency guide for the federal
government. I had been considering the idea for quite some time
and decided to trash the idea. I decided that changing my idea was
a better course of action and instead go with the vehicle maintance
software. Just before I started programming the software I further
decided to program it for an entire fleet of vehicles instead of just
one or two.

Oh well. It's late and I'm going to check out for this evening.

Can you pick up sats with a discone? On what frequencies are these on
aren't they in the 11ghz range? Also, my "scanner" picks up cell phones
at 1400-1600mhz, I can't scan the whole band without running into these
pesky things. I don't know why but I think it's an image, but they're
extremely strong.

I have a Radio Shack Discone and it works fine. I have seen the
higher end discones and they are built better. They appear to be much
more sturdy. I have thought about replacing my Radio Shack discone with
a Diamond or similar myself. I would also assume they also are better
at receiving/transmitting. However, I have also heard that Radio Shack
buys their discones from other manufacturers so inspect the Radio Shack
brand and then the "higher end" models. You will see a difference in
constuction! Good luck...don't make the mistake I made. I bought all
cheap stuff (Radio Shack), then I came to my senses and bought the
right stuff and things work a lot better - in short, do it right, the
first time!

3553. FA: ### MOTOROLA CP-1250 ALPHA PAGER

Newsgroup: rec.radio.scanner
Date: 1999-11-15 00:00:00 UTC
From: pdfdisp@aol.com
Message-ID: <19991114225929.06569.00001291@ng-cn1.aol.com>
Source record: 102375

For Sale: Motorola CP-1250 Alphanumeric Pager, with Warranty

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=197808105

For active people with too much to do and too little time, Motorola gives you a dependable and stylish big screen word message pager so you can get things done with ease. The Motorola CP1250 combines advanced "Big Screen" technology with a premium feature set. The CP1250 can display up to eight lines of text and up to 26 characters per line. It is so powerful that it can even receive and display graphics, such as logos, charts and graphs. The CP1250 supports Motorola's FLEXTM Information Services Protocol to receive and display large quantities of Information Service messages in an easy to read manner. The user-friendly Message Management features allow stored messages to be moved into one of five relevant folders, such as 'task list' and 'phone list'. The 8-line to 4-line zoom control serves to further enhance its overall ease of use.

Get a complete list of features from Motorola's Website at:
http://www.mot.com/MIMS/MSPG/Products/Alpha/CP1250/features.html

This pager is in excellent shape (10 out of 10 cosmetically) and is almost brand new. I've just been given a new phone through work and no longer need it. This pager is worth over $180! Reserve price is VERY reasonable... Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:

http://www.geocities.com/CapeCanaveral/Hall/9255/

New and ever expanding site with frequency lists for the
Edmonton, Alberta Canada area.

We have information for the general scanning enthusiast as well as
those with a bent for Trunk Tracking.

Our general frequency lists are expanding daily with user
contributions. Add yours to the site now!

Email: edmscanner@telusplanet.net

We are also the Web home for EASE. The Edmonton Area Scanner
Enthusiasts' group.

The First Meeting of EASE will take place :
When : Wednesday December 1. 1999
Where: 7:00 PM at Pins and Cues rec Centre
(Bowling Alley and sports bar) Party room
South West corner of Westmount Shopping Centre.
Edmonton Alberta Canada
Why: EASE is a new group to Edmonton area that is looking to
promote and enhance the enjoyment of radio scanning in
the Edmonton area.

The main purpose of the First Meeting would be to "TEST THE WATERS"
here in Edmonton to see if it is worth going forth with the effort to
start a local users/support group as well as a general information
session.

This can give people a chance to meet other scanner enthusiast's and
do some major networking, share ideas and tips,

Also at the first meeting the lastest in Trunking Radio Scannners will
be displayed (Pro92, BC245XLT and Etrunker ver 3.8)

The meeting is open to everyone, from Novice's, the Curious, the
highly addicted, the media and retailers in the Edmonton area.

For more information please visit

http://www.geocities.com/CapeCanaveral/Hall/9522/

The only thing I don't like about the RS model is that the elements
are tubular, with threaded ends crimped in. Are the higher-end models
solid rods? I think the ideal would be solid stainless steel rods.

Source record: 102382

I've got a spool of co-ax cable that was in my basement when we moved in. It's about 1/3 inch in diameter, is double shielded and tinned, and has a steal guide wire that runs along the cable, I guess so it holds its shape. The guide wire strips off easily, leaving the co-ax in tact. I have a verry rough idea of what its worth. Any guesses as to its value are welcome. I might sell it and pick up a scanner. BTW... heh... If you want to buy a paint ball gun, contact me... I'm going to sell it, trying to get a scanner.

>just went totally digital today. They really promoted the reason was so that
>people with scanners couldn't listen to them, and if somebody ever could,
>they could go to encryption very quickly.

That attitude SHOULD not fly with us the tax payers...these systems
are worth Millions!

Did they ask us for the new toy ?

I work in Law...and I can see a sharp lawyer , who is a scanner buff
challenge said methods. That is a very long legal debate....however I
have chatted with a friend , also in law...who said the same...it can
be won in COurt..if the digital interface / scanner deosnt hit the
market 1st.

The plans are way ahead in motion for a digital scanner that will
decode the simple dvp method they use....some use a des-xl that would
be MUCH harder to crack...but the dvp you do hear has been
cracked...and is old nerws on the service bench.

Keep in mind your PD 's system is about 3 yrs old...thats when the
P.O # was sent to whom ever got the contract to place said system.

So in essence , these systems are outdated as fast as they come on
line...the OPP is a fine example......15 yrs ago...and in place /
operation in early 1990.

Like computers these folks who buy this stuff have no idea about the
word _ UPGRADE_.

That alone will kill em , my local PD has long abandon DVP...reason.."
It simply costs too much to maintain " .

As to "no laws", the philosophy is
>that the airwaves are public property. If you want to use them and expect
>privacy, then you, the user, must make the signals private. It is illegal
>here for an unintended recipient to decrypt encrypted signals,

Law breakdown as such....SCA Broadcasts...not scaners.

> or to tell a
>third party what you heard in any transmission that wasn't a broadcast. So, a
>personal conversation (cell, whatever) isn't private, but if you encrypt it,
>then you are explicitly making it private, and the law recognizes that. I

>have overly simplified things, but that's the gist. And I'd love to see how a
>spread spectrum scanner does its thing.

Not sure if that is even worth exploring !

Cordless phones are or can be boring...as well as cells ....I can only
take so much of that stuff....however after 10 pm and on weekends ,
can be funny :)

Just wait....perhaps see Indusrty Canada;'s site ...youll see a
Digital License in . pdf format.....dated 1996...!

Canada has seen the way to the future , and is has long been
prepared..its only a matter of time for the digital scanner...I know
some Unix prog can decode dvp...and some 1st yr electronic students
made some crude , but effective dvp decoders....

3564. Dutch P-3C Orion to NAS Patuxent River (NRN361)

Newsgroup: rec.radio.scanner
Date: 1999-11-15 00:00:00 UTC
From: Scramble Intelligence Service <iwan.bogels@wxs.nl>
Message-ID: <80ohbr$2t5u9$1@reader2.wxs.nl>
Source record: 102386

Hi Scannerfreaks,

Just heard NRN361 taxiing out at NAS Valkenburg in the Netherlands, getting his flightplan clearance direct to KNHK (Patuxent River). The aircraft, a Dutch Navy P-3C Orion, took off at 09.43 hrs LT. For those of you wishing to pick it up on scanner, this means a take off time of 08.43 hrs Zulu Time.

Sorry, no serial available yet.

Happy monitoring !

Iwan Bogels

Sounds like normal Cable TV wire.
BTW, the guide wire is what the Cable is held up by on long runs since the cable isn't that strong.

I have corrected the address
Group: rec.radio.scanner Date: Sat, Nov 13, 1999, 10:34pm (MST+7) From:
guido@mail.icongrp.com Frequency Database
Looking for a way to keep track of all of those frequencies you have
discovered?
SCANNER is the answer. The program features:
* Import and Export ASCII files
* Printed reports by Service, Departmen,
or Frequency
* Ability to sort by any field (or fields)
* Ability to select by an field (or
fields)
Take a look at the scanner homepage located at:

http://www.comnetcom.net/~guido//scanner/scanner.htm

and check out the screen shots.
Only $20.00 brings this fantastic program to your doorstep. Send check
for disk or send check with e-mail address and I can send the program to
you as an attachment.

I'm checking out the Optocom but it sounds like you need different s/w to monitor different trunking format, such as Motorola and EDACS. What is needed to monitor Motorola, EDACS, and the Johnson/Uniden LTR formats all at the same time with the Optocom? If it's different s/w, then what s/w are we talking about? Thanks.

Regards,
Tony

Hey, did anyone ever see that TV movie "Merlin?" I remember in the end, the way they ultimately defeated the evil Queen Mab was to simply turn their backs on her and ignore her. Without an audience to follow her evil ways, she simply disappeared from existance! I think this NG could learn from Merlin's idea!

Bud, I dub thee Sir Merlin, wize Wizard of rec.radio.scanner.

A Message I received from Bill Cheek. I didn't see it posted here in this group!

I already know that I'm going to catch hell from a few of the members here. But the post was wasn't for their benefit anyway. It is posted for those that want to know.

If it irritates you, then please press Delete and move on.

Roger D. Cravens, Jr.
Atlanta, GA

Hi ya, Gang!

Apologies for this impersonal newsgram format, but there are so many of you friends, associates, and solid acquaintances that I have to use this format to let you in on the latest. If you DON'T want to receive any more mailings, let me know and I'll take your address off my list.

THE LEGAL SITUATION
==========
Least importantly, but relative to Cindy's and my legal situation, the Feds still think they may prosecute us, but they're not for sure. They've won several delays, so Cindy and I are still in a holding pattern. But like I said, that issue is not so very important anymore.....

THE MEDICAL SITUATION
==========
The thing I need to tell you about is that recently I was diagnosed with terminal lung cancer. The doctors gave me 3-4 months to live if I don't get treatment. With some relatively new chemotherapy, they said I might get an additional 4-6 months.

The specific diagnosis is "Stage IV Non-Small Cell Lung Cancer". As grim as that prognosis is, there are still rays of hope. Just today, a gentleman gave me a tip on a promising new drug for cancers like mine, now in clinical trials.

I called the company and passed the initial criteria. Hopefully they'll get back to me soon.

But that's why I am writing.....

MY NUMBER 1 REQUEST
==========

No one knows it all, including the doctors. If any of you folks know of promising treatments for lung cancer, I will be most grateful to hear about it, whether medical or holistic.

MY NUMBER 2 REQUEST
==========

If you know of nothing (as most of us don't), then I shall be grateful for your PRAYERS. I make this my #2 REQUEST primarily because God helps those who help themselves.

I remain staunch in my belief that prayer and faith are the strongest forces in the universe.

NOT EXACTLY A REQUEST....
==========
As we are without medical insurance and other significant resources, it's been asked if we accept monetary contributions. Desperation has driven me to say "Yes". Close family and friends took it upon themselves to set up a special account for this purpose.

Contributions can be sent directly to:

Union Bank of California
Acct# 0771354719
8359 Mira Mesa Blvd
San Diego, CA 92126
Attn: Rhonda Smith or Kevin Smith
(619) 230-3800
payable to:
Bill or Cindy Cheek
or Cynthia Cheek trustee for William D. Cheek, Sr.

or, if you prefer:

Cindy Cheek
PO Box 262478
San Diego, CA 92196

MY PRESENT CONDITION
==========
At the present time, I am still in pretty good condition overall. There is some pain, especially at night, and it's been weeks since I had a full night's sleep, but still.... I'm holding my own. My pain killers are Codeine #3 and Vicodan. They work pretty good, so far.

WHAT'S COMING SOON
==========
I am to see an oncologist today to schedule the first round of chemotherapy and possibly radiation (not sure), but if I get accepted in a clinical trial, I'll get some kind of a chemotherapy and a chance at a trial drug.

Between working for a living (which I still can and must do), attending to family issues, and settling my private affairs, obviously I won't be

able to personally answer much e-mail. I will continue writing for MONITORING TIMES through the December issue, after which I'll take a leave of absence.

I'll continue publishing the WORLD SCANNER REPORT through the end of the year, or as long as I am able. But my immediate objectives are to get into and through the chemotherapy; and to live what's left of my Life to the fullest.

CONCLUSION.....FOR NOW
======================
My Life has totally changed over the past two weeks since I learned of the cancer. Things that used to matter a lot .... DON'T. And some things that didn't seem to matter are now all-important.

Time with my wife matters most. Time with radio and computers matters the least. Life certainly has taken a strange turn over the past two weeks.

That's all for now. If you want to keep posted to the latest, you're already on my mailing list and will stay there unless you ask to be removed.

Again, please include us in your prayers!

Hugs to all,

Bill & Cindy

I'd look for a more reliable source for my information if I were you.
However, that said, Art Bell is right. It will work. The problem is
not in the airplane. The problem is on the ground when you saturate
all those cells with your traffic.

I can tell you from personal experience as a private pilot, ham, and
electrical engineer, that once the airplane climbs even 1000 feet in
the air, you'll start hearing traffic from several hundred miles away.

Now ask yourself: At that altitude how many cells do you think will
hear your activity? The control channel protocol keeps you on just
one of those cells. The others will see the activity and knock that
channel out of service.

Now repeat this maybe 20 times over for good effect and what happens?
This is why the regulation was written. It's not to spite the
airplane users. It is to keep things reasonable for the cellular
system operators.

Years ago I worked a aero mobile with an icom IC-2AT.
Barefoot.
He was about 200 miles away.

And also running about 2watts.
146.520MHz
I can understand why the rule was written. And I suspect that if the cell companies log such data they could (at least try) to present such users with a nasty bill.
YMMV

200 miles is the standard service radius for VHF aircraft radios.
They run all of ten watts.

>And also running about 2watts.
>146.520MHz
>I can understand why the rule was written. And I suspect that if the

Tracking down a mobile user like that is very difficult. The offense
has to be repeated multiple times before anyone will do anything about
it...

3582. Pro-92 PC Interface Cable

Newsgroup: rec.radio.scanner
Date: 1999-11-16 00:00:00 UTC
From: pscolombo@aol.com
Message-ID: <19991116174850.29771.00000160@ng-bx1.aol.com>
Source record: 102154

Radio Shack's catalog listing says the Pro-92 has an "optional" cable for PC interface for up/downloading and cloning. Nowhere does catalog or website mention exactly what type of cable this is or where it can be acquired.
To those of you who have received a Pro-92 already, is this covered in the manual? The online manual for this radio doesn't exist yet. Thanks in advance.

3583. Re: How 2 Program a BC145xl

Newsgroup: rec.radio.scanner
Date: 1999-11-16 00:00:00 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <3831E478.B8F9772@dialpoint.net>
Source record: 102155

Stop the scan on the number you want. Punch in the number of the frequency. Hit the E key. YOu are done. Hit the REVIEW buton to see the programed frequency one digit at a time. Move to next chanel by hitting the MANUAL buton.

Forgot what the PRIORITY buton does. MIke make ch# 1 checked when the scanner is locked into another chanel, but just a guess.

Example.

50.25 mhz 50.25E

140.125 mhz 140.125E

You do not need to enter the leading or traling 0 in a number.

140.120 mhz 140.12E

3584. PRO-94 Antenna

Newsgroup: rec.radio.scanner
Date: 1999-11-16 00:00:00 UTC
From: av8tor@flash.net
Message-ID: <_rlY3.2552$16.306249@news.flash.net>
Source record: 102156

Just got my PRO-94 and so far I like it. However I'm wondering if there is a better flexable antenna then what comes with the PRO-94. Seems like the antenna doesn't do as well in the 155MHz area.

You can skip the "favors". The software is easy to come by but the cable is impossible to duplicate. The IC in it cannot be identified. Why wouldn't you just let all know about a good site anyway. You sound like a creep.

EVERYTHING on eBay is overpriced. I've seen Bearcat 350As go for $120 on there. This same scanner sells NEW at Wal-Mart for $94.99 and it doesn't even do 800Mhz!

Does anyone know if the iCOM R-10 has a CTCSS decoder?

I would also like to find out if there is a difference between a R-10 and an IC R-10. If so how do they compare in price. The R-10 seems to list as a 1000 channel with no CTCSS and the IC R-10 is a 400 channel unit with CTCSS?

Any info appreciated including general comments about this radio.

Me too. They gave me the 10% deal when I applied for the card at the same time I was buying the Pro-94 scanner (on sale for $199), ended up getting it pretty cheap! (had money left over for the leather case)....

Yes, there's the Alinco DJ-X10, AOR AR8000, AOR AR8200, Icom
IC-R10, Yaesu VR-500, and Yupiteru MVT-9000. If you can make
due with segmented freq coverage, you have the Racing Electronics
RE2000Alpha, Radio Shack PRO-92, and Uniden SC200.

3619. How 2 Program a BC145xl

Newsgroup: rec.radio.scanner
Date: 1999-11-16 00:00:00 UTC
From: we@bulldog.org
Message-ID: <80rjj2qgt1@news.uky.edu>
Source record: 102264

Subject says it all.
My father bought a Uniden Bearcat BC145xl at a yard sale for $2.00.
It had a blown audio output IC so I replaced it with a LM380. It now works
and when I press the WX button I hear out local NOAA station L&C.

But how in do you enter/assign freqs to the 16 channels.

The display shows only 2 digits at a time in the scan mode, and 1 digit at
a time if you press any of the number keys. Dad finds it funny that I can fix
the thing, but can not program it!
Lost in Central Kentucky!
Why couldn't he have found a Pro2004/5/6 I know how to program them!

3620. Lexington KY fire going trunked?

I heard a rumor the other day that the LFUG fire department is going trunked.
The University of Kentucky has a trunked system for some of it's operations
and it is being expanded to 10 channels and already has
the public school police, transportation and the local mass transit comms on.
Anyone know the skinny on this...no one on campus is talking, or as is much
more likely really know what is going on.
It is a GE(argh!) system.

I by sidebands you mean they are just invetting the audio why not grab a
copy of one of the audio inversion programs that runs on any Wnidos95
system with a full duplex sound card. While $50 is much cheaper than
bvuying a computer, I suspect that most folks here already have a pc
that will do the job for free.

The usual procedure is for Uniden to ship it to dealers for us to
find out for ourselves. Then, about three months later, you begin
to see the ads show up in the normal scanning mags. ;-)

> Do we normally get information> from an "unnamed inside source"
> before Uniden releases info?

Not usually. From time to time there is some "leakage" but
haven't figured out if it is intentional or not!

The last semi-official word on the 780 delivery date is March 2000.

This is not a modified US Pro26. It is the real thing. Model number 20-9506, date code 7A5. It covers 25 - 1300 mhz with NO gaps. All freqs within that range are covered and it scans at the rate of 50 channels per second. You can program up to 200 frequencies into the banks. I am including a $40 "Max 800" antenna (bought from Grove Electronics) designed to optimize the 800 mhz range, a second rubber ducky (along with the original) that is supposed to be the most highly rated available ($25), an AC adapter ($10), a 90 degree adapter for the antenna allowing use with the radio lying flat, and an outside antenna with mounting brackets and about 50 feet of coaxial cable with connectors on each end. This antenna would probably cost $75 to replace, with the coax and connectors. The unit is in like new condition, with box and manual. No scratches or physical defects. Works perfectly. Reduced to $300 and I will pay shipping, which will probably be about $20 with insurance. Email if interested. trunge@home.com

I apologize if this shows up more than once. I have posted this msg twice and it does not seem to be going through.

>Anyone have the poop on the RCA RP6150? Can it be modified? Who make
>it for RCA? On sale in Ohio at Value City for $99.99 this week.

From my April 1998 review in Monitoring Times:

"RCA, formerly Radio Corporation of America, was active in
the scanner market when the crystal was king -- over 20 years ago.
An RCA 16S400 multiband base model is part of my old
scanner collection (Fig. 2)."
"More recently, Thomson Consumer Electronics acquired rights to
the RCA label and has returned to the scanner market with the new RCA
RP-6150 portable (Fig. 1). It closely resembles the 1994-vintage
Radio Shack PRO-62 we reviewed in February 1995 MT. The RP-6150
is a multinational creation, made in China for French-based
Thomson by General Research Electronics (GRE) of Tokyo."
"We used an RP-6150 with a serial number of 004914
for this review. It tunes the conventional scanner bands,
including civilian air frequencies, but excludes the 10 meter
ham band and military air band (see Measurements table).
Its 200 channels are partitioned into 10 banks. Individual lockout
and 2 second rescan delay may be selected for each of the
memory channels."
"Users may choose between AM and narrow band FM modes on any
frequency, useful while scanning the 137-144 MHz range
or vacationing overseas. The RP-6150 has one pair of search
limits and the step sizes are factory set. Frequencies
cannot be locked out during a search as they can in the
newer Radio Shack and Uniden/Bearcat models. ..."

[...]

Summary
"...We're delighted to see RCA reenter the scanner market.
People seeking a no frills, good performing portable and who
don't need military aircraft frequency coverage should consider
the RP-6150. It employs triple conversion and a flexible
battery arrangement, but lacks the duplicate channel detection,
search skip, and empty channel lockout features of newer designs."
"Our sample isn't super sensitive at 470 - 512 MHz and has
some intermod around the VHF railroad channels but is generally
more resistant to image problems than the BC230XLT. The RCA RP-6150
sells at a street price of about $200."

Chris Ross <pragmatist@kc.rr.com> wrote:

>I have the spec sheets for both before me and am at a quandry of which
>to get....

I have two PRO-2005s and a PRO-2006. Except for scan and search
speed, and a lamp defeat switch in second generation PRO-2006s,
they are for practical purposes the same radio. The squelch
circuitry is a little different but you won't hear a difference.

You can often buy a PRO-2005 much more cheaply than PRO-2006,
and it's a good deal. I bought a PRO-2005 in very good condition
for $80, though that's below market value.

If you have a choice between a PRO-2005 and PRO-2006 for about
the same price, buy the one which is in better condition.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS

(Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association

(RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want
to eat or drink, bring it with you, as well as your BBQ or
six pack.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel

Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells | replacement EL panels for the PRO-2004, but Robet Cummings | has modified an LCD from a Miller Engineering | (http://www.microstru.com) experimenter's kit and fitted it | to his PRO-2004. See http://dune.globe- | net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006

Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers |
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner |
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not

specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0

- 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band.

Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT

Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor

contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed

backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by

Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct

channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45

MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64,"

by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and

Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor

dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay.

CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out

("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios.

Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a

custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

So where is the best place to buy a "mint" 2005/2006? What are the odds
of finding one in a box never opened? Since this is arguably the best
scanner ever manufactured, you'd think someone (like Bob Grove!) would
have squirreled at least a few of them away for posterity.

> channel unit with CTCSS?

Is the R-10 you're refering to possibly the discontinued Optoelectonics
frequency counter model?

The "official" designation for Icom's handheld receiver is the
IC-R10. And there are usually a few digits after that to help
differentiate a blocked US model from an unblocked model meant
for export/government agencies.

Sounds like you don't have banks 2 or 3 programmed correctly.
In order for the radio to let you get at those banks' Scan
Lists, there has to be a received data channel in that bank
for it to detect. Once it detects this, it will allow you
to stop the search/scan and access the Scan Lists.

Well, i replaced the batteries within the pack, and it still wouldn't work. The pack won't work with just the ac adaptor either. I'm worried it might be a problem within the actaul unit, and not the battery pack. It worked fine before sitting for a year and losing its batteries. I guess my question is, is there a way to test the actaul unit before i spend another 30 bucks on a new bp200 pack?

thanks
Mike

In these situations it's obvious I have to give information. All
retail stores would *then* ask the appropriate questions.

Radio Shack asks these questions when I pay cash, enter no contracts,
on items I carry out of the store.

I could refuse, and look like a paranoid jerk, but why? Wal Mart
sells the same items and asks no questions. (sometimes cheaper)

I fail to see why this makes it ethical. Battery buyers should not
enter into opt-out marketing schemes.

A few months ago a couple of new in the box PRO-2006 scanners
were put on the auction block. Prices went in excess of
$500 (one went over $800!). Since you can still buy the upper
and lower covers, a new backlight, and new knobs, you would
probably be better off just looking for one that wasn't hacked
to death. I rejuvianted a 2005 and now it looks almost new.

Most I've run into only have the cell mod done, which
is nothing more than a diode snip. When in doubt, ask to
open the top cover and have a look.

Mint condition Radio Shack Pro-2006 scanner with the full OptoScan 456 computer interface and full frequency coverage. It comes comes with the box and manuals for everything, an extra antenna and the newest version of Radio Manager software. I'm asking for $450 shipped but I'm open to offers. This is probably the best scanner ever made and the full Opto456 is nearly impossible to find. Thanks, Chad.

Well, HighWaysinHiding....

I would NEVER accuse you of exagerating or worse...

So it must be true.

And you took that shit? If someone tells me 'store policy' and I
think it isn't, tell them to get their district manager on the phone
and explain it to you. If they refuse, ask them if you should call
1-817-390-3011 (Opps, sorry, that's changed, and I don't know
what the new number is, but if you call that, it will tell you the
new exchange.) and Mr Roberts can explain this new 'store policy'
to you.

Can't you get it, or would you rather bitch? (I think I know the
answer to that one!) THEY ARE LYING TO YOU!! You
caught them in a lie. Wouldn't that be much more fun watching
them squirm and sweat when you call them on it than bitching?
AND you can get THEM in trouble!! I mean, what more can you want?
You get to nail them. You get to make them sweat. And since no
district manager wants to be bothered by these kinds of calls, you
make sure the district manager remembers them fondly!

That can be more fun than falling on the floor when the elevators
open and flopping around like a fish. (Something two of the
engineers at Tandy did once, back around 1983 or so. Only when
the elevator door opened, it wasn't just anybody, it was the senior
VP of Engineering waiting to get on...)

Source record: 102099
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have had one of these charger/conditioners for about a month now. Works good. My batteries do get rather warm though, but not to hot to hold. Matter of fact they would feel pretty good for warming up cold hands! I tested mine with old NiCds and new NiMH AA and AAA cells. Voltages were peaked on all 3. I "conditioned" my old NiCds and they seem to work good. The others were rather new so have not done that yet. My NiMH AA batteries were around 1.56 volts or so fresh out of the charger. I put 10 fresh charged NiMH in my MFJ-259 antenna analyzer and the voltage readout was 13.7 volts right at first, so a bit above 1.36 volts per cell on the older NiMH AA batteries in that unit. I am using the AAA NiMH batteries in a Palm 3x PDA with the battery setting on NiCd because I am using version 3.0 OS which does not have NiMH support, and they work fine. Overall--nice little charger/discharger. I thinnk mine is performing to specs on the box. Good investment. Great size for travel. I also have the Radio Shack plug in AA fast charger. No discharge on that. It is bigger and heavier than the little Maha. Both charge in about the same time and to same voltages. The batteries get just as warm in the RS charger as in the Maha. RS only does AA. The cover on the Maha may provide some protection for an exploding battery (NOT!) but is really just a dust cover! Charge batteries well away from stuff you don't want damaged if a cell pops off! Out in the garage is fine, wx permitting, you don't want it too cold. I once saw a NiCd sub C cell go off at an RC car track. It scared heck out of everyone there. Luckily no one was standing nearby. The pack must have went 30 feet in the air! I would charge with the cover open to help circulate air over the batteries as they charge. Heat is the death of rechargable batteries, but the are warm to the touch when fully charged. They will cool off as the unit goes from fast charge to trickle charge. Hope this helps. Just my humble opinions and thoughts. BTW, anyone using rechargables in scanner alkaline cases that are labled "use alkaline batteries only" because I have heard there is no short circuit protection in the pack, such as on my Yaesu FT-50RD and my Alinco DJX-10T. Both warn against using rechargables and the Alinco case even has a sticker in it to this effect.

Even if your not a ham ...YOU can get yer hands on used stuff via the net .

I am a HAM , however best scannerI own is a Kenwood 77a all for 200 bux..here is what I got

full 800 !

CTCSS

Searchs..ects....

Just like a scanner....it is fast...has a ctcss tone board...can store frqs in memeory...has vfo....

Bottom _____ is same unit , as a scanner is 800 bux....just dont transmit..if your not a HAM !

Get those bids on those Dual Band Radios....!! you get it all for 100 - 200 bux...with a BATT that would outlast most RS Stuff.

Just a thought

3658. Re: What's the cheapest FRS radio you've seen online?

Newsgroup: rec.radio.scanner
Date: 1999-11-17 00:00:00 UTC

Source record: 102103

I paid $56 for a PAIR of Midland FRS radios - 14 channel, CTCSS, etc.

But, you should be able to get a pair for under $75 pretty easily, just not the 'mainline' brandnames.

I actually bought two pairs - both for less than $60 -- the one pair was Midland, forget who made the other pair (presents to kids). I got them at ubid --- www.ubid.com they routinely auction these off -- typical going prices range from 52 - 70 bucks / pair. But since I bought both of them, I have seen them advertised in the paper for local stores for about the same price -- have seen $57 for a pair of Midlands advertised.

cheers

Robert (rc123@globe-net.net) wrote:
: Careful when you generalize... I bought a 486 80Mhz tower computer for $17
: that is running my Opto interface, bought several 56K modems for $20-$25 each,

At least around here, you can buy 56k modems in STORES for about that
price...and by mail even cheaper.

: a PRO-2042 for $180, a PRO-2004 for $225... I've searched all the pawn shops,
: flea markets, hamfests, and garage sales looking for scanners. While many do
: sell for much more than they are worth, the ones I bought are less
: expensive than what they sell for in my area, if you can find them. Set
: your limits, be a smart shopper
: and don't get caught in a bidding frenzy, unless it is something I'm selling.
: ;-)

: Considering a new PRO-2006 sold for $499 at the Shack a few years ago when
: it wasn't in such demand, I'm not surprised at the one sold for a little over
: $500
: recently (though I expect this one was purchased when they were being closed
: out at a reduced price).

Unless you are in a country other than the USA, then you NEVER saw a new
2006 for $499
The unit only listed for $399.

: I wasn't looking to start another long Ebay discussion, just wanted to point out
: what the high demand can do to the price of one of these.

Agreed, E-* prices can become excessive in a hurry.

In the ham radio domain, it is the segment of each band reserved solely for morse code.

14.000 - 14.050 MHz
21.000 - 21.750 Mhz

are good examples of CW bands, tune around there and here the di-dah-dits

cheers and dah-dah-di-di-dit di-di-di-dah-dah

Not sure what context you here this in. It could be referred to as mostly the lower part of some ham bands. YOu will find this around 3.5 to 3.7 MHz, 7 to 7.2 mhz 14 to 14.1 mhz and 28 to 28.3 mhz. Also 50.0 to 50.1 and 144.0 to 144.1 mhz. I MAY BE slightly off and I know I have left our some but do not have my chart in front of me right now. It is usually the low end of the band.

It is the area where Morse code is mostly sent. That is roughly what is commonly reffered to as CW.. Continious Wave. Kind of a crontradiction as the wave is not continious but cut off and on. It is called CW as the Radio Frequency wave was origionally generated by a device that used a dampen wave. Too deep to get into in a short message.

There anre MANY radios below $100.. there are also many below $50. FRS
radios have come way down in price since they first became available.
You will moslty see those radios though at local store, rather than
online dealers.

The bottom line is you shouldn't be encouraging people to purchase
Amateur radios if they aren't, or have no intention of becoming a HAM.
There's far to much crap going on on the 2m band as it is without
telling people to get Amateur radios, "But don't transmit".

Not a year ago and the ones at Office Depot typically are still selling for $50-$75 still (as of this past week). The only ones I've seen for the same cost are sold by stores like CompUSA and have limited amounts, are only offered for one day, and only 1 allowed per customer (bait to get you into the store). As they say... your mileage may vary.

My mistake. I was thinking of the 2042, which did sell for $499

No comments on the $17.00 486-80 MHz tower, eh? ;-) To think I paid $1500 for a 486-25 MHz machine only a few years ago. ugh.

Well Jeff, I'm not sure you'd really notice the difference. It's really the diameter of the tube that's significant for most of the bending strength, assuming the wall structure is a reasonable thickness. Would be easier to crush though - not a normal antenna thing. The tube might even cost more to make than solid, and the lighter weight might even be beneficial for some apps. Consider a bicycle. Anyway, I wish RS still sold these in Canada. They have almost no accessories for scanners or ham here. And most of their pricier electronic stuff IS made by a known reputable manufacturer, and they sell it a bit cheaper.

From: av8tor@flash.net
Message-ID: <A6nY3.2612$16.316577@news.flash.net>
Source record: 102177

I just got a PRO-94 and the more I use it the less I like it. First, several people have complained about the audio, that is the only so far that I like.

I have not used it for trunking yet because there are no systems locally. But next week I"m going to Florida and I'll give it a try (if I don't sell the scanner first!)

Problem 1) Flexable antenna that comes with unit sucks in the 155MHz area (Police). It more than sucks in the 33MHz area (Fire, our county fire is all 33MHz). And sucking even harder is the AirCraft band (my favorite since I'm a pilot).

Problem 2) I thought I'd fix problem 1 by hooking it up to an external ant. I hooked it up to a Discone antenna (inside my room!). Can you spell OVERLOAD, INTERMOD, OVERLOAD, INTERMOD, oh, did I mention OVERLOAD! 155MHz area (our city and county police!) anytime a transmitter keys up, its distorted due to all the other stations coming in!

I hope the 800MHz trunking features are good since that is the real reason I bought this scanner.....

I've owned dozens of scanners over the years and the best over-all preforming has been the OLD PRO-2006 (and I don't give a crap about cell phones either).

I have a Diamond Discone, and the rods are tubular. It fell once and bent a tube. It crimped. Otherwise I like the construction.

To me, the Rat Shcak ant, Icom and Diamond all look identical. I have disassembled and moved the Diamond many times and am quite familiar with it.

Does the Rat Shack clamp down its elements with Allen screws?

I have to agree, I have the radio scrap discone and if you can get one somewhere else with solid rods go for it, I fixed all the broken ones an mine and when I put it back up one broke anyways so it was up there for a year like that, so this time I took it down and had to repair them all over again, got some stainless threaded rod and used special flux for stainless the first time and a propane torch and some stainless solder, this time used a different liquid flux for stainless and a stainless solder with built in flux and a little butane torch, one thing I will say is if this gets to be a thing that has to be done every year I will be getting another one of better quality or finding someplace to get some solid rod the correct size to replace these hollow ones with.

hi we live in oxnard ca. i have 2 uniden bearcat 350a base/mobile scanners. one is new, only opened the box. the other one is like new demo. they come with ant. owners manual, 12 volt pwr supply for home use,cig plug for car, and mounting bracket. it works out to be; "buy one get one free". $100.00 and $10.00 shipping and insurance. they sell for $120.00 a piece in the store. if you need more info ps call me (805) 488-7622 or e-mail ddubsky@aol.com

tnx and good scanning.

That's true about the RS model. I do believe some discones are stainless and DO NOT have the ends crimped. However, they still screw into the "main element." Do you have a local radio store that deals with the higher end equipment in your area? If you do, they have the antennas in-stock and you can see them for yourself. Plus, people who make a living from this "hobby" can give you truly "expert advice." I am not an expert but you can go to grove-ent.com for some good info on discones. Give them a call if you don't have a local store and they can answer your questions, they're great people to work with.

>
I believe they are hollow aluminim which are crimped and can be
somewhat flimsy. I could be mistaken on the material. I have seen
better antennas, without a doubt. I think it depends on what you want
to listen to. My RS picks up things fine but I'm not positive how much
better a "higher end" model would be in terms of reception.
In addition, I doubt (my guess) that a solid material would be better
than a hollow rod. It is a matter of external surface area of the
antenna which is important. Plus I believe it might be harder to get
the signal out of a denser antenna to your receiver. Again, that's a
guess, correct me if I'm wrong. Also, don't forget to get good coax!
I'm using 9913 and I used to use RG-8. There is a big difference! Even
the ends don't come loose on the homemade coax connections!

McMaster-Carr would probably be a good bet. You could probably get
some threaded SS rod.

I think they're at www.mcmaster.com

Awesome company. If you don't have a McMaster-Carr catalog, you
should! Try to get the CD version.

Roger -

While many people on this NG have had strong differences with him in the past, I seriously doubt that anyone desires to see suffering from him.

I thank you for the update you provided, & my prayers are with him as they were when he started having his most recent round of legal problems.

3712. Re: Pro-2005 OR Pro-2006..Which one to get?

Newsgroup: rec.radio.scanner
Date: 1999-11-17 00:00:00 UTC
From: Robert <rc123@globe-net.net>
Message-ID: <38324DFC.34C68DBC@globe-net.net>
Source record: 102196

Careful when you generalize... I bought a 486 80Mhz tower computer for $17
that is running my Opto interface, bought several 56K modems for $20-$25 each,
a PRO-2042 for $180, a PRO-2004 for $225.... I've searched all the pawn shops,
flea markets, hamfests, and garage sales looking for scanners. While many do
sell
for much more than they are worth, the ones I bought are less expensive than what

they sell for in my area, if you can find them. Set your limits, be a smart
shopper
and don't get caught in a bidding frenzy, unless it is something I'm selling.
;-)

Considering a new PRO-2006 sold for $499 at the Shack a few years ago when
it wasn't in such demand, I'm not surprised at the one sold for a little over
$500
recently (though I expect this one was purchased when they were being closed
out at a reduced price).

I wasn't looking to start another long Ebay discussion, just wanted to point out
what the high demand can do to the price of one of these.

Hi, Can someone tell me about this unit.
Yes I know it has 290 channel memories,
Yes I know its very, very small,
Yes I know it also is a transceiver.

Here`s what I need to find out about it,

(1) Is it programmable like a scanner ?
I notice there`s no 123456790 buttons on it to access the desired
frequences.

(2) I would like to know what kind of audio comes out of that TINY
speaker ?
Is there a jack on it for an external speaker?

AND FINALLY, if anyone has one, can you tell me the type of quality the
VX-1R has OVERALL.

Thank You
Bob

I've been looking for software that will decode those voice inversion cordless phones. I have not had much luck searching the net, maybe I'm not using the right words when running a search.

I have a lot of these cordless phones in use in my area and its starting to suck. You know those voices that sound like sick alien ducks Yakin back and forth.

I know its not going to be a so called decoder. Just a program that will put the highs and lows of audio frequencies "or should I say wave lengths" back in order. I'm almost tempted to take my Cobra cordless apart to see what thy are using to put the frequencies back together.

NOT ! My wife will kill me if I take apart something else that's not broke. She does not understand the Tim Allen "IF IT AIN'T BROKE FIX IT ANYWAY" motto. Oh Well

Thanks for your help!
Arthur

I fail to see the point. The effort people take in posting rants about
Radio Shack and their mailing list here and on other systems but
they are afraind to say "REFUSED" or "CASH" to some guy at a
terminal. Does being behind a counter and at a terminal give him
some magical intimidation power? They have a one button sequence
(or used to) for the case where a customer refuses. It's quick, it's
painless, and contrary to some individuals opinion, it DOESN'T
make you look like a paranoid jerk.

This thread has gone on way to long, and I deserve to be flamed for even attempting to bring some reason back to it, but it is cold here so I can use the HEAT!
Monday night I needed 12 identical small electronic items. The RatShack[SM] was the only place in Lexington Kentucky to acquire them. I could have waited untill Tuesday and phoned my order to MCM (not meant s a plug, just I deal with them a lot, and have not had any problems)but I really wanted to finish the project up and what the heck, I was building something for some one else and they where the ones paying.
The sales droid at the first RS that I went to insisted that he could not complete the transaction [cash as always] without my name. The manager said[to the effect]"it is our store policy". My response was "f off. eat sh and see how much of my money you get in the future". I then walked out.
Went to three other RS (I had a lot of places to visist that night so I was not going out of my way) the next only had 10, and they wanted my ID, but not to the point where they were no going to complete the sale. This service droid informed me that they (sales droids) where chewwed out for not getting name etc. I said that that was too bad but this was the good old USA and these are not controlled items so they might want to revisit there policy.
His response [to the effect] that the goons]his word not mine!]where total Aholes and he did not see how they stayed in business. Further revealed that this is a tmep job to get money to buy Christmas gifts but if they gave him any more "pep talks he was going to leave and flip hamburgers. That McDonalds was a more pleasent place to work, just there he got nice discount.
The next RS had the last 2 parts that I needed and they too where insistant that I give them my name. I pulled out a few dollars and read them the part "legal tender for all debts public and privite". And told them to either sell me the part or call the police. IF they I was being diruptive, and refussingf to leave (a common ploice call in this area) lets let the law decide.
Further that I would love to see the headlines over the event and wondered what RS HQ would think of sucjh publicity. They shut up, took my cash and one followed me out of the store (I guess to take down my tag number) I asked why he was following me, and after he mumblbed something unclear, I pulled out my 2Mtr HT, brought up the autopatch and calmy asked "Are you stalking or other wise trying to invade my privacy" and "do I need to call the police" his response"no man, no, Mark is just mad over the way you jerked his chain and told me to get you license number" I then asked if he thought that was a good idea and did he really wnat to see the police that night? HE apologized and slunk back to his lair. I considered contacting the police, it really does help to be active in radio as I have met a lot of the local cops, and they are overworked but generaly fair, but decided it was not worth my time.
So be warned, some RatSahck[SM] jelots take their orders very literaly.
And get freaked out by any attempt to skirt their rules.
In the future I will use B. Clinton 1600 Penn DC, or something like that.
It would be fun to wire my self for sound, get a friend the video tape the next incident and put it up on local public access on cable TV.
I wonder how Tramp AKA RatShack would like that?

Well, but you were right about the more important point, which is that
they are hollow, which means they break easily.... :-)

Are you saying they are the same hollow stainless as the Rat Shack? In
which case it doesn't seem like there is $30 to $40 worth of
difference between the two.?? Yes? No?

Thanks for your help,

Hello All.

I have an ICOM PCR-1000 that I am trying to sell. I will also include the
Mobile antenna and cablefor free. I am trying to save for an AOR 8200.
I have only had this unit for a month and have made no modifications or
anything like that.

Please contact me at

r.l.green@gte.net

3752. Re: Question about a YAESU VX-1R

Source record: 102236

Yes it is programable like a scanner. You just spin the dial to pick
frequencies - or better yet, use the computer interface (ADMS sold separate)
Audio is very good.
Quality is good but it has too many limitations to really work well as a
scanner. I sold mine and bought a VX5R which I totally love. It is the
best "scanner-in-a-ham-radio" I have found. It has 5 banks and a favorites
list. Good audio, battery life, and its a tri-band for Tx. For a bit more
you can get an uncut version from Bandercomm.

Brett - N7OLQ

Back in the days when only women wore earrings and men walked the surface of the Moon, the Motorola HT-220 was the hottest handheld on the market when it was introduced in 1969. Tougher than a pit bull, this VHF or UHF business band handheld in a weatherproof housing was the envy of ham radio operators for its compact size and performance.

The HT-220 Page has been updated and includes photos and discussion of special HT-220s such as the Secret Service, Medical ECG, and Touch-Tone models. This website has information including model tables, frequency conversions, parts and accessories, manual numbers, tech tips and stories.
See http://www.batnet.com/mfwright/HT220.html

Comments about the HT220 by visitors to this webpage:

"THOUSANDS STILL IN USE."
"I use both VHF and UHF models everyday."
"I've taken VHF units up to 220 MHz (a real 220 220)."
"HT220 is truly an object deserving of such a shrine!"
"It was and still is a engineering marvel."
"They are very easy to re-condition."
"I still think it is the nicest looking, most purposeful radio ever produced."
"The HT-220 still lives!"
"I cut my teeth on the HT-200 and went on to the HT-220."
"I can remember in the mid-70s the envy we all felt for the BMOC that had an HT220."
"What is that?!?" (from a generation X-er first seeing a HT220)

I believe that it is legal to own any type of scanner in the US regardless of what it receives. The only limitaions nowadays are that you cannot buy a cell capable scanner from a company. Also in some states it is illegal to carry a scanner in your vehicle. But if your scanner is old enough that it was manufactured before the ban on cell coverage started then it is OK. I am not sure if modifying a scanner is illegal or not.

>
> I so sorry that your Provider has such a S L O W connection for you. You
really ought to get with the program though and get a faster modem if it
loads that slow for you.

I use a cable modem. Speed is not an issue. The popup ads and seizure of
control over my computer to open up multiple browser windows whether I want
them open or not is excessively annoying. I will not stay at a site that
behaves that way or ever visit it again.

Nor do I enjoy wasting my time "voting" by clicking links that say "Enter
Here" only to be led to some other website that has nothing to do with the
information I thought I was going to see.

The more obstacles you put in front of visitors to your website, the fewer
visitors you will have.

3761. Need help finding an IC for an old scanner

Newsgroup: rec.radio.scanner
Date: 1999-11-18 00:00:00 UTC
From: Mike <please@no.email>

It's an old Regency HTX hand held that fried.

It looks like something fell off inside and crossed some pins on one of the IC's.

Problem is, I can't find any electronics houses who can cross reference the number I got off the chip. I'm hoping that someone here has run across this chip and knows of someone that sells it.

The number on the top of the IC is 10420 and it's 16pins. That's it. No name, no letters, nothing.

Any ideas?

> which contain quantitative test results.

Thanks for your input Bob. The area I'm in has a couple of different systems, one Motorola I/II and another with a "failing" EF Johnson system, plus conventional dispatches for Fire and EMS. The PD's are all on the Motorola system.

I'm pretty much set on the 92 because of its increased multiple system capability. I'm just hoping the audio is a little better than the Uniden bc245, which wasn't any better than the 235.

I'll look for your reviews - MT is a great publication.

thanks again
dc

LOL... good one Chuck.

Seriously though... I have three words for you. Cash is king.

I could go out to any ham shop in Phoenix right now and buy a ham radio from them and they will not care who I am , or if I'm licensed or what. I got money and that's all that matters. Period. You can buy anything in this country, legal or not, if you have the M-O-N-E-Y. Making ham radio's illegal to own without a license will do nothing more than drive the price of the radios up. People will still sell them. It's hard to turn away CASH MONEY.

Just like the car analogy someone made in this thread. Should someone own a car without a license? Think carefully about the possiblities...

Does Stevie Wonder drive? Obviously not. But I bet he owns a fleet of limousines, one or two boats, a private aircraft, etc.

Are you saying he should not, because his disablility prevents him from operating them? I don't think so...

Does Donald Trump or Bill Gates know how to fly their own private planes or sail their own yachts? I doubt it. But following your logic, they should not own them because they don't know how to fly or sail.

See? It's not so cut and dried, is it?

Now I grant you, there is no reason why someone would NEED a ham radio if they aren't licensed to use it, but that doesn't mean they shouldn't get to own one. Many hams I have met got their start because they bought an HT out of curiousity, and later decided to get their ticket so they could fully use their new toy.

A qualified technician wouldn't need it. They'd just toss the board and install a new one.

And to address the points of people down under, without insulting anyone, which is unneccessary here, let me say this:

If you don't like the scanners made for the US don't buy them. Wait for the model designed for your country that has all the bands properly restored. Either that, or live with it the way it is. Simple, no?

And to answer the point about the nutso's with guns around here. They don't just stroll into KMART and buy a handgun, OK? They buy them with cash, out of the paper or out of the back of a pickup truck, where no check is conducted. Same thing happens in your country too, I guarantee it. Gun control does NOT deter bad guys getting guns. It just creates another criminal element that services that demand. And they jump for joy when another gun-law is passed, making their wares that much more valuable.

Many politicians in your country as well as ours say people don't need to own a gun for any reason, and shouldn't be allowed to. Didja know that? They're trying to use every tragedy caused by PEOPLE with guns to convince the public that GUNS alone are the cause. And people being the sheep they are, are buying into this whole heartedly. Ba-a-a-a-a-a-a.

What does this have to do with scanners, someone asked? Plenty! If they can get a yes vote take your guns away, how much easier of a target would scanners be? I'm shocked that more people don't see it this way. Scanners, guns and government are more closely related than you think, boys and girls.

I bought several Johnson model 242-8565 radios from a thrift shop. These are 800mhz range units. I think they may be LTR units. I have six radios, chargers, and extra batteries. What do I need to program these radios to make them useable? I would like to use them to scan some of the local LTR systems and maybe set up a couple for simplex use. Thanks to all in advance.

A Ham transceiver a time can offer a better return on your dollar and more features and options then a dedicated receiver. Having a license doesn't guarantee the radio will be used correctly, listen to some of your local hams. :-0

Unless you have a very good, almost magical, reciever I do not think you will
pick up any satellites in the 1GHzplus with out either a dish, or other high
gain antenna. I have picked up milsats in the 200-400 range with a diskcone,

but they were rather weak and I was running the 455 KHz IF out into an out
board reciever.
And yes the cell phones you are hearing are images and will drown out any
"real" signals in that band.
Good listnening!

Kenwood is the only one that appears to actually "scramble" the voice coms.
Their website goes into some detail on how good it is. I thought only the
feds or police types could legally scramble. I would love to have one to
play with for a day or so and just see how well the "scrambling" does work.
I use my 2mtr (and for that mater my 6mtr) more than FRS, but not all of my
friends or family are hams.

I came along this program called Frequency Webcatcher. It is
suppose to take frequencies that are on any website, and insert them
directly into your AOR 8k via ARC (or possibly other) remote control
software.

I think you misunderstood. I meant use the bicycle *instead* of the discone. Best when mounted on roof with radial element supports ("wheels") perpendicular to ground, mast inserted in seat post. No bylaws in many places regarding these, unlike most other outdoor antennas. Side benefit is your neighbors think you're nuts, so they won't be bothering you to borrow stuff.

Not that I'm a 100% sure, but it MAY be a progged chip...
And the number is just the serial or progname...
In that case it would not help to find a similar chip, cause u need to prog
it with the same software as it has right now...
Try to get hold of those who made it and ask... (if they still exist :))

Try Mouser.com or Digikey.com. I doubt you'll have any luck, even if you
do find the same IC because that chip's probably a programmed IC.

Re-read my prior response & THINK. I know about Coke's plans just like
you do. What you haven't demonstrated is how you have "exposed the
truth" about the antenna on the Coke machine, because you haven't
demonstrated that the antenna is directly or indirectly related to
Coke's notion of remotely adjusting prices in the vending machines.

3797. PRO-92 trunking performance concerns

Newsgroup: rec.radio.scanner
Date: 1999-11-18 00:00:00 UTC
From: Dan Morisseau <dpm3@postnet.com>
Message-ID: <3834D37A.2F1FF4D0@postnet.com>
Source record: 102031
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I've just (something like 24 hours ago) received a PRO-92 direct from the RS warehouse. I've found a few features that I am impressed with. The increased sensitivity over my usual handheld - AR-8200 - is quite nice, it has good "heft", alpha tags are quite nice, etc.. I've quickly developed some reservations, however, with respect to its trunking performance.

The directions for entering trunked frequencies are ... succinct might be a good word. Apparently, they are significantly easier than the dual "mode" thing my BC-235 utilizes. The directions seem to suggest that one simply enters the frequency(ies) as any other non-trunked ones in the bank and set the mode to the appropriate (in my case "MO" for Motorola) system you are scanning.

Once frequencies are entered and trunk tracking is begun, however this unit's performance in tracking the various talk groups compares poorly with the old BC-235. Talk groups seem to shift number IDs while the conversation is in progress. Sometimes these numbers are identifiable as simply 32 digits removed from the correct Type II ID. At other times, the ID number is so far removed as to make a quick calculation of its relationship in terms of multiples of 32 impossible. It seems to lose track of transmissions - even in "closed" mode or even when on "ID hold" status.

Is anyone else experiencing such poor performance? Is it possibly related to marginal reception of the signal? I must add that my 235 doesn't display such flaky performance nearly as often (I am maybe 10 - 12 miles from the transmitter). Could I have misread the programming directions? Is there a not-so-obvious step that I could have overlooked? Are there other resources - mailing list, web sites (I know of Rich Wells Strong Signals site), etc. that might be of help.

If I've programmed the radio correctly and this performance is typical of the breed I think that acceptance in the hobby us going to be marginal at best.

Thank you for the posting on the PRO-92, Bob. I curious about the VHF high band performance since it is a GRE-made receiver. I have owned Radio Shack PRO-2006s, PRO-2035, PRO-2042, and an Optocom and found all of them to have poor reception on VHF high band even with an external antenna and a suitable antenna (compared to other receivers like AOR, Uniden, and amateur transceivers like Yaesy and Standard). What has been your experience with the PRO-92 on VHF high band?

That's a couple of really amusing tales that you guys have just related! The guy was really going to take down your tag number?! Man, talk about misguided authority! Those stories had me LMAO.

I LOOK FORWARD to the times I use cash at RS, just so I can see their reactions after they ask for my name, and I say "You don't need that". They usually get this blank, confused look, then ask why I won't give my name, and I say "Because I don't want my mailbox jammed full of junk", (which is a total embellishment, since I'm already on their list :-)

Randy I agree....and respect your opinion...as the post implied , it
was just athought after seeing Americans cant get full 800 scanners ,
yet most dual banders will monitor full 800 - 999 MHz without a prob ,
with ctcss...and the BATT lasts for ages if you dont trasmit..

Hey that was my 2 cents...maybe it will encourage more hams ?

Again , just a thought.

Today I bought $22 worth of stuff at the local RS (batteries and phone cords), and the bastard didn't ask me my name and address! In fact they haven't asked me my name and address the last few times that I've been in there in the last few years.

<sarcasm>
Is there a phone number that I can call to report these people?
</sarcasm>

Since I don't buy newspapers, I wouldn't mind getting back on their mailing list. Oh well. :^)

Ron of that ilk.

I'm not a HAM operator but I can see such behavior turning HAM into
CB. If you don't earn a license you've got no right to own a HAM
radio with transmit capability.

Right about now is where some idiot says "Oh yeah, I guess I shouldn't
own a car if I don't have a drivers license".

Exactly!

The CHP in Rancho Cucamonga has been reporting skips (39.88 MHz). I assume the (unknowing) offending party uses the same PL tone. This is a fascinating phenomenon. It makes AM DXing a lit of fun that's for sure.

Jerry,

I don't believe the Opto board with tone capability is still available. Only the "lite" version, without P-L decoding, is still sold through Opto retailers.

Jeff Multer, Fort Mill, S.C.

>to about 512 MHz!!

The early Uniden synthesized scanners would display frequencies outside their receive range when they went into test mode.

I don't know about 900 Mhz frequencies, but my 250 would display mid-band (76 Mhz) and mil-air frequencies.

http://www.laughingpoliceman.com

Greetings fellow radio enthusiasts

Our wonderful radio club, the Laughing Policeman Wireless Society, is
celebrating its FIRST birthday on the web. Thanks to all our contributors
and everyone who visits the site on a regular basis.
g8aso@hotmail.com

A popular feature is the Find People page which links to all known call sign
data bases as well as UK map finders to accurately locate any radio amateur
in the UK. Even if the person you seek is not on the data bases, we can
usually find them, and we have only one failure this year! So "details
withheld" is meaningless with the help of the LPWS! Not only that, we use
the information to add the dubious character to the call sign data bases, so
he is there for others to find, we also disable the on-line update, so he
can't modify or remove the info in the future, a positive service to the
amateur community!

We have 2 complete download sites, both active, and 2 in reserve in case of
loss of access. The download sites are maintained independently so no
copyright material is kept on the LPWS web server. The 2 URLs are:-
http://members.xoom.com/BAJONES/
http://members.xoom.com/g8arsehole/
Both sites are identical, and either can be used to download the complete
Radio Ham featuring Tony Hancock, in a Zip file of a mono MP3 file.

We recently added the TV news report of the Aylesbury repeater bomb, again
in MP3 for ease of download. Hear it here
http://www.laughingpoliceman.com/bomb.htm along with a new press cutting
from The Sunday Times, sent in by one of our contributors.

Go direct to our download page here:-
http://www.laughingpoliceman.com/free_downloads.htm
and don't forget the free LPWS email that we now operate entirely for and on
behalf of our amateur radio friends.

New Logo. the previous LPWS logo was a blatant rip-off of the RA one, with
some changes, although not enough to stop them whinging! We have now
re-designed it, although the RA logo was our inspiration, the new one shares
no pixels with the RA one so, hopefully, they will leave us in peace. Check
it out now.

Please report any errors and omissions to me and I will get them rectified
without delay, and don't forget to email me with any further additions etc.
complete anonymity if required. Let us know what you want, and we will add

it, we are only using 10% of the space on our server!

LPWS Publicity Officer G8ASO g8aso@hotmail.com

Oh god guys, I have been a ham since 1973. It has never been exactly a showplace for virtue or skill. Anyone else remember the (too) many conditionals, and lets not even look at the whole WE program. Liberty net, to 2mtr clowns ham radio is just like any other human activity. There are always idiots and fools that mess up things for the rest of us. You should have heard the crap when a local ham to be "illegally" used her boy friends HT about 20years ago whne her appendix popped and she could not get to a telephone. The "old timers" nearly had a calf. So lets not hold ham radio up as any sort of ideal. After all non of the Liberty Net goons are a codeless tech, the idea that any one test, skil whatever screens for common sense is funny. Anyone ever been to a mensa meeting? Talk about clueless. Rude and stupid inspite of having high IQs.

You might want to put an isolation resistor (I used 10K) to keep
external "stuff" from loading it down. And while you in there, find
a good spot to tap the 10.7MHz and 0.455 IF. I used 10K with a series
.0001 to couple both to output jacks. I can use my SW to liten to
SSB/CW on the ham VHF/UHF freqs.

The RatShack has their FRSs on saole for either 24.95 or 29.95 and in spite of being Tard..er I mean Tandy stuff they work very well. I like the Motorolas with the VOX headset better, but for those on a buget the RS jobs work great.

The RatShack(SM) has FRS for less than $30 (I think 24.95 but it could
well be 29.95). Nice basic radio. They work very well and come in some
really wierd(but popular with the some of the younger crowd) colors.
I prefer the motorolas with the VOX headset, but they are much more
expensive. And do not have any greater range.
And please note that I have nothing to gain by this recomendation..I am
NOT in any way connected to the RatShack as other than a sometimes
reluctant customer.

Not quite. If you're not a HAM, you have no right to transmit. That's it.

You can own whatever you want.

>Right about now is where some idiot says "Oh yeah, I guess I shouldn't
>own a car if I don't have a drivers license".

Why? Can't people collect cars or work on them as a hobby? You don't need a license for that.

I am looking to buy my first scanner. I see a lot of mention that a PRO2006 is/was the 'best scanner'.

Is it 'better' than a BC245XLT?

Is the 2006 a good scanner for a first scanner?
I understand that the difference between Opto 456 and Opto 456 lite is that the lite does not have PL decode. Do I need that, can I get it some other way?

What is a reasonable price to pay?

TIA,
Ron

3847. FS: Pro-92 Trunktracker

>I'm considering the purchase of a PRO 92 but the only difference I can
>see between it and the 94 is the addition of the Uniden/EF Johnson
>trunking systems and alpha tagging , and you get that in place of an
>extra 500 channels.....

There are other differences. The current $200 PRO-94 sale
price is about $130 less than the PRO-92 street price.

The PRO-92 has both PL (CTCSS) and DPL decoding squelch
and instant display.

They employ a different method of following trunked
conversations and different delays when scanning
multiple trunked systems. The considerations
may be important when scanning large, busy trunked systems.

The PRO-92 supports one talk group ID list of up to 100 IDs
per bank. The PRO-94 supports 5 lists of 10 IDs per bank.

I tested a PRO-92 and PRO-94 for for Monitoring Times magazine.
The PRO-92 had noticeably better audio. Watch MT for the reviews,
which contain quantitative test results.

Do you know if the rat shack ones also use the ctcss (or whatever) for
"private" channel use?

(I know it's not really private).

Get a scanner that receives SSB. Then put in USB or LSB mode and tune
slightly off frequency and the signals come in loud and clear. I used an
Icom 7000 for this, but there are cheaper scanners available that have
SSB on them.

Right on! Why are there always these Al-Bundy clerk morons that come to the defence of RatShack everytime someone has a LEgitamate complaint?? I DON'T WANT TO have to threaten to call their District Manager, or call some long distance # in Texas or give a phoney name & address or... every time I want to buy a 99 cent item. I know that it's SUPPOSED to be OK to "just say no" , but as the fifty seven million honest posters to the net can attest, many stores are really hassling people over their refusal to hand over the personal info. And although they say they don't sell your name Today, belive me it's not "illegal" for them to "change" their bullshit iternal policy at any time, just like the "we will always only sell our own brand", You'll never see a price on a radio shack catalog"...ect. Seven or 8 years ago these statements were gospel to all the Al Bundy managers. Today it's sprint , tomorrow all the sprint signs come down & it'll be MCI or whatever. Last month all employees must ask every customer to get a cellphone, next month forget that, ask them about Microsoft sign up......

Hello,
the european versions go 930.0125 - 933 MHz base to handheld...and -45 MHz
the uplink handheld to base. The use 50kHz steps but start with 930.0125
FM-narrow....and a few with voice inversion...but simple
Best regards

: illegal, they would probably be met with equally overzealous use of force.
: This author advises anyone and everyone who is interested in pursuing the
: interest of radio communications to be good little citizens, give the FCC
: your name, social security number and home address so that they may
license
: you properly and you will then be allowed to purchase and use the
following
: gear with the included caveats.****
:
:
: To Sparhawk,
:
: IMNHO, try finding a Pre-1999 Yaesu FT50 at a HAM swap meet. They are
: obscenely simple to freeband (open up to reception and/or transmission on
a
: very wide number of frequencies). Another good one that doesn't need
much
: modifications to receive a ton of freqs (including, but not limited to: AM

: and FM radio, Shortwave, TV sound, police, fire, FEMA, State agencies,
: Federal Agencies, 800 mhz and some 900 mhz (with the cell freqs blocked.
.
: .no, honest!)). Neither of these are inexpensive, running about $300 -
$400
: apiece. Both are extremely durable and conform to several mil-specs for
: water-resistance, shock and dust.
:
:
: >
: > 2. what affects the range of a handheld (I want about a five mile
: > range)?
:
: Good luck without a repeater. I've barely pulled 5 miles under the best
of
: conditions with the small "rubber ducky" antenna on my handhelds unless I
: was plugged into something other than the standard battery pack.
Everything
: in your environment affects transmission and reception from how hilly (or
: not) the ground is to solar flares.
:
:
: >
: > 3. are throat mikes/ ear-pieces a gimmick or real advantage in certain
: > situations?
:
: Both have their advantages. I have a couple of different ones, but they
are
: also expensive if you're looking for waterproof ones. You will also have
a
: difficult time finding any specifically made for HAM radios. Luckily, the
: commercial brand of Yaesu (called Vertex) has a lot of high-quality throat
: and bone-conduction mikes available from aftermarket producers (do a
search
: for "New Eagle" on the web).
:
:
: >
: > 4. can you encrypt/scramble communications with a handheld?
:
: Yes, you can illegally modify a Digital Encryption System board into your
: handheld. You may want to get a business radio (e.g., a Motorola Sabre)
: which already has the board installed. Again, check legal issues here.
The
: FCC has deemed it to be against the law to encrypt amateur radio signals,
: but a few have done it. DES systems are also a touch expensive (around
$600
: for state-of-the-art boards. . each) and I'd recommend having someone who
is
: an accomplished radio repair person do the installation which will also

add
: to the cost.
:
:
: >
: > 5. why the interest on the signal ranges of handhelds?
:
: See above comments upon what you can receive.
:
:
: >
: > 6. can a base station be used to boost the range of handhelds in a
: > geographic area?
:
: Yes, and some handhelds can do this also. Do a search for (IIRC) the
: Kenwood TK-G71 which has a built-in cross band repeater.
:
:
: >
: >
: > I am not a HAM operator and training in such is a way down my list of
: > priorities. What I do need immediately is to set up some form of basic
: > 'portable' communication system that is secure as possible.
:
: See above. Also I'd suggest going legal. HAM's are known to have little
: else to do but play frequency cop and will actually get together to track
: you down if they find out you're transmitting without your license. And
: this is painfully easy to do. Some look at it as a sport. When they find
: you, they will turn you over to the Federal Authorities.
:
: Unless you want the FCC SWAT/HRT team kicking in your door, go get a basic
: No-Code Technician's license. Practically anyone with an IQ over 80 who
can
: remember a few basic rules can get it. Go to Radio Shack and buy their
: 6-tape No-Code license instruction tapes and listen to them on the way to
: work. The tapes cost about $30 for the set and teach you everything you
need
: to know to get started.
:
: However, even the highest level of amateur licensing will not allow you to
: transmit encrypted messages. . .so I'd suggest saving that for a true
: TEOTWAWKI scenario.
:
:
: >
: > I have run a search on the newsgroup but recent posts on this topic
: > were scarce. I would appreciate any help that is out there.
:
: Few people here will talk that much about it. Again, HAM's can be a bit
: overeager in their flaming of such suggestions. Some of what you've

: discussed can actually be dangerous if you don't know what you're doing.
If
: you have a powerful transmitter and your mike locks open on a freq used by
: cops, fire or emergency personnel, it can cause a major problem to them,
so
: there are some true concerns to be worried about.
:
: >
: >
: > John M
: >
: > PS: as an aside I note on 'Die Hard 2' the radio used was a Kenwood TH -
: > 450-AT. Does such a radio with such capabilities exists - I cannot find
: > it on the Kenwood site.
:
: Probably, but remember the terrorists were government guys with access to
: the best equipment. There's a lot of stuff that is simply not sold to
: regular people.
:
: Oh to have the set up that I had when in the military, but alas, I cannot
: afford (or will not spend) $2 - $4K on a handheld that eats up batteries
: like a member of Overeater's Anonymous who's fallen off the wagon at an
: all-you-can-eat salad bar. Lithium-Ion batteries cost big $$ and alkaline
: AA's drain very quickly when you start adding DES capability and transmit
on
: the highest power settings.
:
: Just some thoughts, hope they help.
:

3873. Re: What is "CW" band?

Newsgroup: rec.radio.scanner
Date: 1999-11-19 00:00:00 UTC
From: zeno@magicnet.net
Message-ID: <hliZ3.142210$Ow5.220963@dfw-read.news.verio.net>
Source record: 101904

CW in the HAM radio world means Continuous wave, or transmitting in Morse Code. There arer diferent HAM frequency bands that have CW transmissions. CW has more "puch" per given wattage than "phone" or voice transmissions.

In article <3832CC4E.3241@gwis.com>, paul and jacki <jacki2@gwis.com> wrote:

> My wife thinks it stands for Country Western Band. Seriously, can

Does Anyone Know if you can turn off the BEEP on the pro51...i do not have the manual to it...I have also tried the support area from the tandy website...but no luck...it really would be helpful..

Thanks,
Jason

Try putting your scanner into the search mode and building your own frequency list. It will be far more accurate that way then relying on someone elses out of date list.

I have yet to find a scanner list in the Minneapolis / St. Paul and surrounding area thats even close to being accurate. Most of the people just copy from one frequency list to another, and never bother to verify the information. So it just gets passed further and further down the line.

At one time there was a scanner club here in the area...But too many people just took and never gave back to the group.

There is an informal group of us scanner nuts/monitoring hobbyists that frequent the 145.370 K0MSP wide coverage Repeater which is located in Minneapolis. Everything is game on this repeater..From communications to mom and pop type stuff, to politics. It verys widely with peoples ideas and opinions and thats what makes this repeater the most fun of any of them I've ever been on..Try it, but be ready for some major Fun :)

That is very interesting. The manual says that the defualt is for a Type II. So I shouldn't have to set the size code for a Type II system.. Are you saying I always have to set it to 15 for all my Type II systems?

3890. PRO-94 won't find data channel.

Newsgroup: rec.radio.scanner
Date: 1999-11-19 00:00:00 UTC
From: av8tor@flash.net
Message-ID: <yulZ3.4697$16.563275@news.flash.net>
Source record: 101921

I programmed my PRO-94 with the trunk freqs of our local power company. I think I did everything ok, I can hear (in conventional mode) the datachannel. However when I go to trunk mode, it keeps searching as if it never finds the datachannel.

Now, I'm not 100% sure if this is a M II system or not. Its NOT digital as I can hear people talking on each frequency as well as the data.

Am I missing something?

George

I ordered my BC245 yesterday. And I think from what I have read, it is
exactly what I need.
I favored 245 because of computer control. And I am really glad I didnt by
the 92 from what you two have put together.

I will let you know what I think about the 245.

This may be obvious, but did you remember to hold down the Trunk button to enter Trunk programming mode before you entered the freqs? I forget that all the time. Otherwise it may not be a Moto control channel...

3897. Some random BC245XLT observations

Newsgroup: rec.radio.scanner
Date: 1999-11-19 00:00:00 UTC
From: Bryan Costin <bcostin@clark.net>
Message-ID: <G2oZ3.39861$oa2.216952@iad-read.news.verio.net>
Source record: 101928

My BC245XLT arrived the other day from Grove Enterprises and I've played with it as often as possible since then. I'm upgrading from a Radio Shack Pro-90, which as I'm sure most of you already know is virtually identical to the original TrunkTraker, the Uniden BC235XLT. I was going to wait and see what the Pro-92 had to offer, but the outlook on that scanner is looking rather grim for folks who want to monitor Motorola systems, so I decided to take the Bearcat plunge.

So far I'm very happy with the unit. Programming and general operation are, as you might expect, almost exactly the same as the Pro-90/BC235. The only real differences are in regard to the new multi-trunking features and the inclusion of EDACS support. I currently don't have any information on EDACS systems in the Baltimore/Washington area, so I haven't been able to play with that feature yet. (BTW, I'd welcome any local EDACS information or comments.)

I can say that the multi-trunking option works very nicely. I live in Carroll County, Maryland, and units from this county are often called to assist in neighboring counties and vice-versa. Being able to monitor both Carroll and Balimore County, for example, can come in handy when something big happens. The ability to include convential frequencies is also useful for those surrounding areas that are not yet trunked, and for monitoring the backup lo-band system that units are sometimes forced to use in areas with poor 800mhz coverage. (I wish I had this scanner a month ago when I was trying to monitor a big fire in Ellicott City that involved units from three seperate counties.)

I'm a little surprised that the infamous five-second delay hasn't been a big deal for me so far. That said, the rural and suburban systems I generally monitor are rather quiet compared to the Big City, and that leaves lots of time for the scanner to switch banks or modes without missing anything. YMMV.

I found the procedure for traking multiple banks a little confusing at first--the DATA key gets quite a workout switching between scan-list positions, banks, and active groups. Reading Rich Wells' excellent review (http://www.strongsignals.net) answered most of my questions, and I'm quickly getting used to it. The remote control functionality, as exersized by a Winscan demo version, is pretty nifty. I often use my mobile scanners as base units when I'm at home, and adding computer control and programming capability will give me lots of fun new capabilities. In general the new features are integrated well with the existing functions and are pretty easy to use while staying out of the way when you don't need them.

Complaints? Well, I wish they'd included some way to leave the light on all the time, or at least remove that annoying autolight time-out. And the NiCad

battery pack is an idea whose time was gone a long time ago--give me AA's every time. One other thing I still find a little irritating is how easy it is to accidentally overwrite a talkgroup in your scan-list while in one of the new modes. You can overwrite frequencies in conventional mode, too, of course, on both this unit and the Pro-90. But now making this same error in trunking mode is just a matter of hitting DATA one too many times and accidentally typing over a talkgroup when you intended to swap banks or scan-lists. Don't get me wrong, this is really not a big deal--every scanner I've ever used has a quirk of some kind, and this quirk is much less bothersome than some others I've seen.

To preach for a second, as scanners mfrs are cram more and more sophisticated features into old, generic form-factors I think that this kind of problem will only get worse. And I'm sure it sometimes forces the designers to leave out things that all of us would love to see, in part because implementing them would be so darn confusing. My ideal scanner would look and act more like a PalmPilot with an antenna than a overgrown walkie-talkie, and the first company that creates such a scanner will make me a happy man. ::: Stepping off soapbox :::

In conclusion, a very nice unit that does a great job and works as advertised. It's a logical evolution of the TrunkTraker line that points the way toward even better things in the future. Go buy one. :-)

-Bryan

If this scanner is for sale, why is there an e-bay attachment? Shouldn't
the subject header say "FA" or For Auction?
I thought E-bay was canning all the ads for cell capable scanners?

3901. AR8200

In a way they have. But ebay seems to pick and choose who can and cannot sell "cell capable" scanners. I have seen Pro 51's 2006's and Yupi's that have "CELL PHONES" right in the header, go full sale, while others get yanked early. I am assuming that they only pull a sale if there is a complaint.

The following unit is surplus to my needs and is looking for a good home.

Pro2032 200 Channel Scanner (Base/Mobile Unit) with original
box, antenna and manual.
Date Code 3A4 (March 1994)

This unit has been operated in a smoke-free environment.
It has never been operated mobile.

Modified as follows:

1. Discriminator Tap -- can be used for digital signal decoding with programs
like TRUNKER, RADIO RAFT, etc.
2. Crystal Speedup -- slightly faster search and scan function.
3. Full 800MHz -- as shown at http://members.home.net/gary-jacek/Pro-2032c.html

Click on "Pro-2032 Specifications" to view the factory specifications for this unit.

$100US plus shipping.
Payment in advance by Postal Money Order.

Please respond by email.
Please remove "trap." from my email address to reply.

3915. Callsign Prefix Database and Look Up

Newsgroup: rec.radio.scanner

Howdy.

I was asked to add a prefix look up utility. It is now available on the QSL page at http://hfradio.org - If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

Don't forget: http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

This is my offering to the community, all funded by me. I am working hard to bring excellent content to the site. I have need for others who might wish to assist. I need a Software editor -- someone who can review and post software links, etc. Let me know if you are interested. (See the site on how to email me).

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

The TK10420 is the main FM IF/Discriminator/amplifier chip that is
used in numerous scanners such as the Pro-2035/2042/2006/etc. It was a
very popular IC made by TOKO which unfortunately has been
disconnected. It was made in pretty large numbers that it is able to
be found at several locations. There are two models of this chip, DIP
and DSO....same chip...just different pkg. You could find the part
number under the detailed parts listing of the forementioned scanners
at http://support.tandy.com.

Sounds like you did not set the size code for your motorola systems. If they are type II systems, set it to s-15. Otherwise, you will have to determine the size code from the system. This is on page 58 of your manual.

> when on "ID hold" status.

This seems to a problem with the subaudible tracking scheme used by
the 92 firmware compared to the data channel/subaudible scheme used
by the Uniden models. I just have a "twinge" of this problem on the
systems in my area (although I haven't had as much time to play with
the 92 as I'd like!) It sounds like some users have more problem with
this than others. Not sure if it's related to overall reception (lack
of noise) or not.

> Is anyone else experiencing such poor performance?

Yes. It does appear a common problem but the degree to which it
effects others comes in varying degrees.

TK10420 is not a programmable IC and it is discontinued. The part number I listed previously is for the 16 pin dip, not the surface mounted package. Since you indicated your scanner is old, I expect it does not use surface mount parts.

Now the real question is can I put this sucker to work on 27.065MHz or even
better here in central Kentucky how about 146.76? With that amount of power
I just might be able to bring up the local "machine". [privite joke..I have
seen times when 100W less than a mile away will not bring up a certain local
repeater..but it will bring up the Cinci Ohio '76 machine!]

The manual, like the Icom software is useless. What do you need? I will dig
around for mine and can try to scan it. But again it does not really help
you get the radio up. IF you are also stuck with the wrong software, just go
to Icom Americas site and grab the "latest" software. Then do a net search on
PCR1000 and get some real software for your radio.

We're planning to buy our son (age 31) a scanner for Christmas but don't know anything about them. Want a good one but not toooo expensive. We didn't want to just go into Radio shack and buy what they recommend.

He wants to listen to local police/fire/meds and (occasionally) local portable phones. Don't know if that's illegal or not but that's what he wants.

Any info would be appreciated. Don't know if I can get back to this newsgroup or not so would appreciate response sent to me at: thehossman@hotmail.com.

Thanks

No, you are not...

What was in the news was that a FOREIGN SUBSIDIARY of Coke
was looking into machines that adjust the price depending on
conditions. This was in ONE FOREIGN COUNTRY.

This has NOTHING to do with CocaCola corporation at all,
NOTHING to do with the US, and NOTHING at all with the
antenna systems.

In fact, CocaCola corporation has distanced itself from this foreign
entity stating for the record it is something that would be detrimental
to their US market.

Here in the US, CocaCola has experimented with very intelligent
vending machines, but NOT for price. And while I do know a bit
more, I will NOT spout it on the newsgroups.

Below is a statement, obtained directly from the Coca-Cola web site. Although they deny the rumors, it clearly substantiates my claims, that this was definitely in the news.

Bill Crocker

STATEMENT ON VENDING MACHINE TECHNOLOGY

ATLANTA, October 28, 1999 - Contrary to some erroneous press reports, The Coca-Cola Company is not introducing vending machines that raise the price of soft drinks in hot weather.

We are exploring innovative technology and communication systems that can actually improve product availability, promotional activity, and even offer consumers an interactive experience when they purchase a soft drink from a vending machine.

Our commitment for 113 years has been to putting our products within an arm's reach of desire. Offering the products that people want at affordable prices is precisely why Coca-Cola is the favorite soft drink of people in nearly 200 countries around the world.

The new technologies we're exploring will only enhance our ability to deliver on that promise.

And The Globe reported that Chelsae Clinton was an alien too...if you're going to pass along "news" (just to be the proverbial nice guy I suppose)
you should substantiate your claims first. A simple look at the Coca-Cola
corporate website disproved this claim instantly.

But *yes Bill* you were right, this was in the "news".

Note to non MI listeners: WXYT is a mostly talk AM station that can be a little on the "extreme" side, mostly the extreme right, but not always...

Chris
